Copyright (c) 2019, Wypasek Data Science, Inc.

## General ReadMe

The primary objective of WDS-JniPMML-XLL is to provide model evaluators to Excel. In particular, access to the standard PMML evaluator is a starting point, both for use or for comparison. Later versions will be include other model specs and implement other evaluators.

See documentation articles for a brief introduction.

## Through this version, WDS-JniPMML-XLL provides:

- A pair of Excel AddIns (XLLs) and VBA support for:
  - o Evaluating PMML models
    - As an Excel function call
    - Using the *de facto* standard implementations
    - Using input data from an in-worksheet table
       Uses XmlMap'd exportable ListObjects, but provides tools to facilitate
    - Can evaluate one or multiple observations (rows) per call
    - Results returned as normal function outputs
    - With cachable models for efficiency
  - Additional data wrangling tools for
    - Importing/Exporting HDF5 compound datasets
    - Importing/Exporting flat files
  - Additional VBA module handling
- A Java wrapper of jpmml.evaluator
  - o Callable from the XLL via jni
  - Testable as a standalone from the command line
     But, can be called through the Excel AddIn using the JVM.
  - o Input and output data can be:
    - HDF5 compound datasets
    - Flat files
    - In memory (as when called through jni)
- Examples are included
  - o A test workbook and launch .bat to run the AddIns without installing
  - o A test set of the usual PMML cases

## **Prerequisites**

- 64 bit Excel
  - Although, if compiling, 32 bit could possibly be added.
- Access to the VBA project object model (if using the VBA module handlers
- HDF5 and HDFView
  - The HDF5 and HDFView libs are required if compiling, but the functionality could be removed.
  - The provided jars require at least HDFView be on the path or the path passed in as a command line option when starting Excel
- Java jdk-12
  - Required when using the latest HDFView install.
- Compiling environment
  - The github configurations are for Visual Studio Community Edition and Intellij Community edition.
- DocFx

DocFx is use for the documentation build, including the DocFxDoclet for on the JavaDoc side.

## **License Note**

All code contributions and development from Wypasek Data Science, Inc. (WDataSci) published on its public github site is released under the MIT license. Code from other sources is noted as such, and any assemblies, XLL's, and/or jars that may contain other software (for example, as Apache's Maven or ExcelDna may bundle from other sources) are released along with the commonly used IDE project and/or solution files used to generate them.

# TODOs, version 0.5.0

Outstanding items and items for the next version:

- Additional documentation and expanded test suite.
- Date and DateTime datatypes are not fully implemented. They are preliminarily setup to pass as doubles, but wrangling of string values, detection via cell information, and testing needs to be performed.
- The object cache and Handle/Tag handlers could be written better.
- Additional HDF5 utilities, such as returning a layout and querying an element when an HDF5 is used like a memory mapped file.
- Expanded VBA library.

An interesting thought or wish list:

- External memory mapped files, using the DBB wrangler.
- A parallel assembly for calling from MSSQLServer.

Related projects to be published on WDataSci's github site:

- WDataSci XML Model Specification, documentation and tools, including xsl implementation transformations.
- WDataSci Systems Model, documentation and tools.

**Brief Introduction** 

Additional Usage Notes

Notes on JniPMML

Notes on Java x Cs

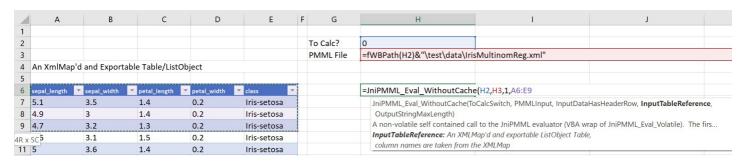

## **Brief Intro**

The primary objective of WDS-JniPMML-XLL is to provide model evaluators to Excel. In particular, access to the standard PMML evaluators is a starting point, both for use or for comparison. Later versions will be include other model specs and implement other evaluators.

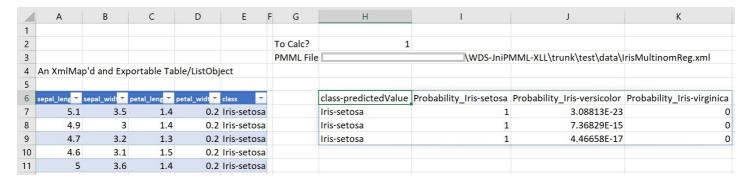

A quick easy way to evaluate PMML should be available to anyone, even those without access to the latest data science tools. In the finance industry, Excel is ubiquitous. To academic-type data scientists who might scoff at using Excel for anything, it is still a tool which can be used smartly or extremely poorly (which can certainly be said of Python, R, Java, C#, or anything else).

## **Simple Example**

For one-time evaluations (less efficient, but simple), data is arranged in a table object. A macro is provided to assist in providing a technical requirement on the table. The JniPMML\_Eval\_WithoutCache function takes just a few arguments as below:

In older versions of Excel, results could be returned as an array-valued function, but in Excel 2016, the *spill* feature allows the function to return a dynamic number of rows and columns:

One thing that might not be obvious from the images above is these are function results. The inputs may even be randomized and (relatively) instantaneous evaluations returned.

# **Slightly More Complex**

More efficient model evaluation involves caching the model and then repeated calls to the evaluator without having to do all of the parsing process of the model implementation spec for every calculation. There are several steps involved, but are simplified in the workbook:

• Pick a Tag for model

If you are thinking this should be called a *Handle*, that would seem correct. Except, the Handles are provided and controlled by the Java side and Tags are used on the Excel/C# side.

A Handle actually has two parts, *HandleMajor.HandleMinor*. The HandleMajor is unique to the Tag and the cached model on the Java side. The HandleMinor increments with subsequant configuration changes, such as caching the input schema from the ListObject and the output schema. Why do this? It is an Excel-trick. When other ranges depend on the HandleMajor.HandleMinor value of some cell, and that cell recalculates, the correct cascade of recalculations occurs.

Provide a PMML Model

Here the model can be either a path to a PMML file or (more interestingly) a full PMML file as a string. Why take the string? One could build the file in the workbook. Perhaps one is testing some transformation structure or just wants to see what happens.

#### • Create a handle

Cache the PMML model on the Java side and return the new handle to Excel.

### • Cache the input and output headers

Based on the input XmlMap'd exportable table, update the HandleMinor. This also internally caches the model outputs which can be queried for column headings.

Note: Some PMML models are harder to fully determine the output structures and results are returned as a dictionary-like structure. In the current version and for this case, there is a function, JniPMML\_Expand\_ComplexValue that can be used to return an expansion. See the WDS-JniPMML-XLL-Test.xlsm workbook for an example.

### • Point to input and return the evaluation

The input is an XmlMap'd exportable table. Before that raises any concerns, there is a macro available through the ribbon, "Add XmlMap to Selected ListObject", which will assign one to it through the following steps:

- Select a cell in a table or the entire table
- o Hit the macro and you will be queried for one of the following
  - Point to an external XSD file
  - Point to an XSD as a string in a cell
  - Infer one from the table
  - Use a cached PMML dictionary, matching by column name, and infer where a column is not in the dictionary

### The slightly more complex example:

	А	В	С	D	E	F G	H I
1						Tag	IrisMultinom
2						PMML File	=fWBPath(H1)&"\test\data\IrisMultinomReg.xml"
3						Handle	=JniPMML_CreateHandle("JniPMML",H1,H2)
4	An XmlMap'd	and Exportab	ole Table/ListO	Object		Cache I/O Headers	=JniPMML_Eval_CacheHeaders(H3,A6)
5							
6	sepal_length 💌	sepal_width	petal_length	petal_width	▼ class ▼	Return Header	=JniPMML_Eval_OutputColumnHeadings(\$H\$4)
7	5.1	3.5	1.4	0.2	Iris-setosa	Single Row	=JniPMML_Eval(\$H\$4,0,A7:E7)
8	4.9	3	1.4	0.2	Iris-setosa	Multiple Rows	=JniPMML_Eval(\$H\$4,0,A8:E10
9	4.7	3.2	1.3	0.2	Iris-setosa		JniPMML_Eval(HandleOrTag, InputDataIncludesHeader, InputData)
10	4.6	3.1	1.5	0.2	Iris-setosa		Calls JniPMML.Eval based a previously set Header
11	5	3.6	1.4	0.2	Iris-setosa		InputData: Select Contiguous ListObject Rows, include header if needed for alignment.

#### With result:

	Α	В	С	D	E	F G	Н		J	K
1						Tag	IrisMultinom			
2						PMML File		\WDS-JniPMM	L-XLL\trunk\test\data\IrisN	AultinomReg.xml
3						Handle	1.1			
4	An XmlMa	p'd and Ex	portable Ta	ble/ListOb	ject	Cache I/O Headers	1.3			
5										
6	sepal_leng	sepal_widt	petal_leng ~	petal_widt	class	Return Header	class-predictedValue	Probability_Iris-setosa	Probability_Iris-versicolor	Probability_Iris-virginica
7	5.1	3.5	1.4	0.2	2 Iris-setosa	Single Row	Iris-setosa	1	3.08813E-23	0
8	4.9	3	1.4	0.2	2 Iris-setosa	Multiple Rows	Iris-setosa	1	7.36829E-15	0
9	4.7	3.2	1.3	0.2	2 Iris-setosa		Iris-setosa	1	4.46658E-17	0
10	4.6	3.1	1.5	0.2	2 Iris-setosa		Iris-setosa	1	7.84035E-12	0

See the provided Excel test workbook for additional examples.

# **Additional Usage Notes**

Accessing Java via JNICode creates a COM AddIn
 Efforts have been made to make sure COM objects are clean up. However, should the process break for whatever reason, there may be an Excel process hanging around. In that case, look in the taskmgr's details. Or, use something like the powershell snippets in the scripts folder to find and stop.

## Notes on JniPMML

Author: Christian Wypasek

## **Simple Motivation**

My daughter, a college student, asked me to explain this project in one sentence and this was as close as I could get: Scientists build models. For even something as simple as linear regression, there is a formula that needs to evaluated. It might be for my own purposes, or it might be for a company I work for, but model implementation needs to be easily accessible. Even though data scientists might use special tools, everyone in financial services at least has Excel.

## **Slightly More Technical Motivation**

Regardless of whether or not Excel might be highly regarded as a computational framework among academicians, it is ubiquitous in financial services (even if it might not be used well). Therefore, it makes sense that invoking an XML based evaluator from within Excel would be worthwhile. In particular, since Excel can enable rapid visualization, one should also be able to compare evaluator implementations and view model response to variable changes and/or model structure in a live manner.

## XML/PMML

For someone like myself who works across the spectrum of big data projects (project management and business interface, data science, and data engineer) and works across multiple programming languages, consistency of treatments is a fundamental key to efficiency. After years of engineering databases, building complex statistical models for financial instruments, and incorporating these models into asset backed cash flow valuations, the greatest risks in this data science process are often operational. There is the most obvious question, "Is the data being used for forecasting sufficiently like the data the model was fit on?", but one also has to ask "Is the model being calculated correctly?".

From personal experience, hand coding something like a scoring model requires significant quality checks and carries the persistent risk that something was overlooked. It does not take too many hand coding events to make one believe there has got to be a better way, both for efficiency of process and the reduction of mistakes that come from mind numbing exercises. Starting back in 1998/1999, I started using markup styles to facilitate both the modeling process and facilitating the implementation for scoring and other types of regresson and non-parametric models. Since then, PMML (predictive modeling markup language) as become an industry standard.

The PMML standard has evolved and early versions were not sophisticated enough for my needs. For example, the Scorecard implementation was not added until the end of 2011, and transformations were not added until 2014. For all that it is, PMML is still a communication standard for model implementation and is often generated after a model has been fit. Continued diligence is required so the communicated model truly represents the intended relationship between the input data and the output results. A process oriented view of statistical model building starts with data preparation and can be exploited at every step of the process through to final implementation.

There may be more than one way to skin a cat, but very few which leave you with anything looks like a cat. My personal work has included using mathematical and statistical model specifications in XML with implementations in SAS, C++, Python, R, indatabase (Vertica, MSSQL) UDTFs in C++/Java/R, and VBA (in Excel). After drilling into PMML implementation details, there is still much to be desired. An updated XML specification used by WDataSci for model fitting and alternate implementations will be released on the its github as a later project, but transformation (such as through XSLT) into PMML for delivery is reasonable given the industry standardization that PMML offers. Other model implementation specifications, such as pfa, will emerge, and Excel will remain a platform for either a model delivery or easy comparison.

## WDS-JniPMML as a multi-language project

The JniPMML project combines several APIs, each for a specific purpose:

- Java
  - The *de facto* implementation of PMML is jpmml.evaluator. JniPMML-Java wraps the implementation in a manner that creates a standalone jar that can also be called from C# via jni.
- C#

Using the ExcelDna project to facilitate Excel functionality, the JniPMML-Cs assembly wraps the jni calls.

- \/F
  - Some odds and ends which I have traditionally done in VBA, but using ExcelDna .Net. In particular, wrangling of the VBA modules is done in VB.
- VBA
  - Certain Excel functions created with ExcelDna through either C# or VB become *volatile* in that they recalculate at every calculation event (which can be a bad thing). However, good old fashioned VBA can do the same thing in a non-volatile manner.

Working in different languages for different aspects of a larger project is not unusual. For example, database work might be done in SQL, with processing either in database or written-out-processed-read-back-in, and final summaries might have an entirely different framework. When sub-projects have many parallel functions, the tendency of programmers to have a project on one side and then start from scratch on the other side, can lead to unexpected differences which the programmer then might struggle to balance. Complete one side, move to the other, discover some new or useful treatment, go back to the first side, restart loop. This project also started in that manner.

Passing data back and forth in-memory between Java and C# involves packing memory in a particular way, which also turned out to be the HDF5.Plnvoke bulk writes a HDF5 compound dataset (such as R can export). Development of the project included consideration of in-memory HDF5s, which despite HDF5 docs, is not ready for prime-time. For testing purposes, HDF5 CompoundDS and flat file functionality is included in the JniPMML-Java project and the Excel AddIn.

Finally, the Excel AddIn also includes other tools representative of some extended functionality I have come to expect over the years, such as VBA component wrangling and other examples. Even if this project is not used extensively outside of WDataSci, this project also become an in-house reference for C#/Java differences and quirks, DocFx, Excel AddIns (quirks across C#, ExcelDna, VB, VBA, COM, non-COM), PMML (and jpmml quirks), HDF5 (and quirks across HDF-Plnvoke, HDF-Java, HDF-Object), etc.

## Notes on Java x Cs

Author: Christian Wypasek

The mirroring of the C# and Java code is meant not to be slick or cute. It is simply because both implementations are reading and writing the same formats. When handing off data in a ByteBuffer between C# and Java, in both directions, the formats must be exactly the same. (Note, not going down the AST route. It seems like if you are going to go that route, you should be all in.)

Some syntax differences are too big to bridge, such as in how enums are more flexible in Java than C#. With enums, just the values and methods (extensions in C#) are in common. The source codes will still be organized similarly, but this is also why enums are not otherwise in the files with their naturally associated classes.

Some syntax differences are not marked but obvious:

- Non-method properties, such as length/Length or boolean/Boolean, which are easy enough to fix in IDEs.
- To break String object references in Java where C# does not require it, a simple new\_String() function in C# is a pass through and differs only with the "\_".
- Method throws required in Java but not C# are on separate lines and commented out in C#.
- In switch-case statements on enum values where Java case statements do not require qualified names, there will be two lines one uncommented for Java, the other commented for C#, and visa-versa.

The syntax differences for many common methods amount only to the case of the leading letter, such as with Java's String.toString() vs C#'s String.ToString(). When this leading case issue is on a class method, they can be minimized through C#'s static extension methods, included in a static class, JavaLikeExtensions. Why not just let one letter differences ride, like in length/Length above? One line in one file and one less thing to highlight a difference in vimdiff. Other differences can be eliminated through specially named classes, mimicking names and methods used on the Java side, such as Map, PrintWriter, and ArrayList. Even though broken out in the documentation, on C#, they can all be included in the WDSXJava.cs, along with JavaLikeExtensions.

Syntax differences over lines or blocks are handled in two ways: First, when a one line change is required, a comment leading with //Java or //C# precedes the line. On the Java side, the //C# and subsequent line are collapsed, commenting out the C# syntax. The reverse treatment is used on the C# side.

For example, in C# version:

```
//C#
if ( !base.Equals(arg) ) return false;
//Java if ( !super.Equals(arg) ) return false;
```

And in the Java version:

```
//C# if ( !base.Equals(arg) ) return false;
//Java
if ( !super.Equals(arg) ) return false;
```

For larger blocks, we can exploit the behavior that an open-comment /\* jumps over other open comments until the first closing \*/. Therefore, in the C# version (Note that the Java >>> comment is open):

```
/* C# >>> */
if ( !base.Equals(arg) ) return false;
/* <<< C# */
/* Java >>> *
if ( !super.Equals(arg) ) return false;
/* <<< Java */</pre>
```

And in the Java version (Note that the C# >>> comment is open):

```
/* C# >>> *
if ( !base.Equals(arg) ) return false;
/* <<< C# */
/* Java >>> */
if ( !super.Equals(arg) ) return false;
/* <<< Java */</pre>
```

There are multiple programming languages used in this project:

Note: This documentation bundle was created using DocFx, which was confusing documentation across APIs. Therefore, a separate PDF has been generated for each.

## Java APIs

## JniPMML-Java

The initial design of JniPMML-Java is to wrap jpmml into a single jar which can be called from Excel/C# via JNICode. However, it is a standalone that can be used with command line calls. It therefore has wranglers for text and HDF5 files in addition to the ByteBuffers for interacting with C#.

### **WDS-Java**

General utilitities that independent of JniPMML code. To simplify assemblies and jars, this code is included in the larger projects, but is also compiled as a stand alone.

On the java side, there is a separate WDS-00.00.00.jar generated but it is pulled into a shaded jar so that only one WDS-JniPMML-00.00.00.jar needs to be used in practice.

## C# APIs

## **JniPMML-Cs**

The Java style com.WDataSci namespaces are specifically for C# code which mirrors the Java modules.

The JNI namespace originated externally, but with a few local completion and extensions.

### **WDS-Cs**

General utilitities that independent of JniPMML code. To simplify assemblies and jars, this code is included in the larger projects, but is also compiled as a stand alone.

The Java style com.WDataSci namespaces are specifically for C# code which mirrors the Java modules.

The C# style namespaces are not specifically mirrored in the Java code.

## **VB APIs**

## JniPMML-VB

The JniPMML-VB code is primarily for some additional Excel manipulation functionality. In particular, the wrangling the Excel VBE components. The ExcelDna and Microsoft.Office.Interop.Excel libraries are generally mirrored in both C# and VB, however, ExcelDna UDF functions which take references as objects so that information about the caller can be determined at run-time become automatically volatile. For this reason, there are several function wrappers implemented in VBA which must be either in an another addin, or as a VBA module in the workbook. The JniPMML-VB (and supporting WDS-VB code which is pulled into the assembly) addin facilitates these wrapped functions by providing a wrangler for a WDSJniPMML.bas module.

## **WDS-VB**

General utilitities that independent of JniPMML code. To simplify assemblies and jars, this code is included in the larger projects, but is also compiled as a stand alone.

# **VBA APIs**

## **WDS-VBA**

The WDS-VBA code is a collection of VBA macros that can be included in Excel workbooks and there are C#/VB macros accessibly through the ribbon to wrangle them in and out of workbooks as needed.

There is a necessity for at least the WDSCore macro for adding ExcelDna Intellisense capabilities.

# C# APIs

## **JniPMML-Cs**

The Java style com.WDataSci namespaces are specifically for C# code which mirrors the Java modules.

The JNI namespace originated externally, but with a few local completion and extensions.

Classes

DBB

DBB is short for Direct ByteBuffer, which on the Java side, is used as the internal data memory map which is being used to hand off data between C# and Java.

Despite the overhead on the both the C# and Java sides, the effective use is as a contiguous array of byte data. The main block can be thought of as a rectangular region for a table of data where each column has the same width in bytes (variable length fields are a long's width pointing to variable space). This is essentially the way HDF.Plnvoke packs memory before bulk writing a compound dataset. Here, we add leading bytes for the essential layout and a block of space after the rectangular region with enough space for the variable length fields.

There are also three layouts:

- WDSH
  - a header layout which includes a record for each column/member/field
- WDSD
- a record set layout associated with a header
- WDSC

[TODO] a combined layout, with leading bytes, space for the header, and space for the record set

The layout for the leading bytes is common across all three and takes 8\*8=64 bytes:

START	LENGTH	PURPOSE			
0	8	The layout style, 8 bytes for 4 UTF-16 characters for WDSH/WDSD/WDSC			
8	8	the total number of bytes required for this layout			
16	8	The number of leading bytes before the fixed length region begins			
24	8	The total number of bytes for the rectangular or fixed length region			
32	8	The total number of bytes for the variable length region			
40	8	The number of records (or rows) of data communicated			
48	8	The fixed number of bytes per record			
56	8	The maximum variable number of bytes each record may require			

WDSH, the header layout needs to communicate just enough information to describe the core meta data for each column. This includes its name, a possible second name (generally used to point to a premapped FieldName used in the PMML dictionary), and several additional meta data ints and longs. 40 fixed length bytes per column are for:

START	LENGTH	PURPOSE
0	8	Name variable length string pointer (long)
8	8	Optional second name variable length string pointer (long), 0 if not used/mapped
16	4	integer for data type code (see enum eDTyp)
20	8	long for number of bytes column data requires in the contiguous portion (variable length fields will have no more than 8 for a pointer to the data)
28	8	long for maximum byte length of data ( fixed length strings are packed directly, null padded, variable length strings represent a long (IntPtr) to other memory)
36	4	(extra integer space, not used)

For variable length strings, the rectangular space will hold the offset from the start of the leader bytes of the space holding the string. For allocation purposes, each string could be expected to occupy 4+MaxByteLength. When a string is greater than MaxByteLength, it will be trimmed to MaxByteLength-2 to null terminate, this may change, but any 2 (UTF-16) consecutive 0 bytes will be taken as a null termination.

For further illustration, the WDSD layout including leading bytes is:

вьоск	BLOCK START	BLOCK LENGTH	START	LENGTH	PURPOSE
Header	0	LeadTotal=64	0	8	UTF-16 bytes for WDSD
			8	8	LayoutTotal=LeadTotal+LayoutFLenTotal+LayoutVLenTotal
			16	8	LeadTotal
			24	8	LayoutFLenTotal=NRecords <i>RecordFLen</i>
			32	8	LayoutVLenTotal=NRecordsRecordVLen
			40	8	NRecords
			48	8	RecordFLen

BLOCK	BLOCK START	BLOCK LENGTH	START	LENGTH	PURPOSE					
			56	8	RecordVLen					
FLen Region	LeadTotal	LayoutFLenTotal	0	LayoutFLenTotal	The densely populated rectangular region, RecordFLen bytes for each of the NRecords	VLen Region	LeadTotal+LayoutVLenTotal	LayoutVLenTotal	0	LayoutVLenTotal

[TODO] For a WDSC layout, there is only one record, it's fixed length region is the space for the WDSH and the variable length region holds the corresponding WDSD.

### Class DBB

DBB is short for Direct ByteBuffer, which on the Java side, is used as the internal data memory map which is being used to hand off data between C# and Java.

Despite the overhead on the both the C# and Java sides, the effective use is as a contiguous array of byte data. The main block can be thought of as a rectangular region for a table of data where each column has the same width in bytes (variable length fields are a long's width pointing to variable space). This is essentially the way HDF.Plnvoke packs memory before bulk writing a compound dataset. Here, we add leading bytes for the essential layout and a block of space after the rectangular region with enough space for the variable length fields.

There are also three layouts:

- WDSH
  - a header layout which includes a record for each column/member/field
- WDSD
  - a record set layout associated with a header
- WDSC
  - [TODO] a combined layout, with leading bytes, space for the header, and space for the record set

The layout for the leading bytes is common across all three and takes 8\*8=64 bytes:

START	LENGTH	PURPOSE
0	8	The layout style, 8 bytes for 4 UTF-16 characters for WDSH/WDSD/WDSC
8	8	The total number of bytes required for this layout
16	8	The number of leading bytes before the fixed length region begins
24	8	The total number of bytes for the rectangular or fixed length region
32	8	The total number of bytes for the variable length region
40	8	The number of records (or rows) of data communicated
48	8	The fixed number of bytes per record
56	8	The maximum variable number of bytes each record may require

WDSH, the header layout needs to communicate just enough information to describe the core meta data for each column. This includes its name, a possible second name (generally used to point to a premapped FieldName used in the PMML dictionary), and several additional meta data ints and longs. 40 fixed length bytes per column are for:

START	LENGTH	PURPOSE
0	8	Name variable length string pointer (long)
8	8	Optional second name variable length string pointer (long), 0 if not used/mapped
16	4	integer for data type code (see enum eDTyp)
20	8	long for number of bytes column data requires in the contiguous portion (variable length fields will have no more than 8 for a pointer to the data)
28	8	long for maximum byte length of data ( fixed length strings are packed directly, null padded, variable length strings represent a long (IntPtr) to other memory)
36	4	(extra integer space, not used)

For variable length strings, the rectangular space will hold the offset from the start of the leader bytes of the space holding the string. For allocation purposes, each string could be expected to occupy 4+MaxByteLength. When a string is greater than MaxByteLength, it will be trimmed to MaxByteLength-2 to null terminate, this may change, but any 2 (UTF-16) consecutive 0 bytes will be taken as a null termination.

For further illustration, the WDSD layout including leading bytes is:

вьоск	BLOCK START	BLOCK LENGTH	START	LENGTH	PURPOSE
Header	0	LeadTotal=64	0	8	UTF-16 bytes for WDSD
			8	8	LayoutTotal=LeadTotal+LayoutFLenTotal+LayoutVLenTotal
			16	8	LeadTotal
			24	8	LayoutFLenTotal=NRecords <i>RecordFLen</i>
			32	8	LayoutVLenTotal=NRecordsRecordVLen
			40	8	NRecords
			48	8	RecordFLen
			56	8	RecordVLen

ВLОСК	BLOCK START	BLOCK LENGTH	START	LENGTH	PURPOSE					
FLen Region	LeadTotal	LayoutFLenTotal	0	LayoutFLenTotal	The densely populated rectangular region, RecordFLen bytes for each of the NRecords	VLen Region	LeadTotal+LayoutVLenTotal	LayoutVLenTotal	0	LayoutVLenTotal

[TODO] For a WDSC layout, there is only one record, it's fixed length region is the space for the WDSH and the variable length region holds the corresponding WDSD.

### Methods

### cAsBigEndian()

Declaration

public DBB cAsBigEndian()

Returns

ТУРЕ	DESCRIPTION
DBB	

### cAs HDF5 Bulk Compound DSW rite Layout (Int 64, Int 64)

Declaration

public DBB cAsHDF5BulkCompoundDSWriteLayout(long nRecords, long nRecordFLenBytes)

Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int64	nRecords	
System.Int64	nRecordFLenBytes	

Returns

ТУРЕ	DESCRIPTION
DBB	

### cAsNotBigEndian ()

Declaration

public DBB cAsNotBigEndian()

Returns

ТҮРЕ	DESCRIPTION
DBB	

#### cAsReadOnly()

Declaration

public DBB cAsReadOnly()

Returns

ТУРЕ	DESCRIPTION
DBB	

### cAsSimple()

Declaration

public DBB cAsSimple()

Returns

ТҮРЕ	DESCRIPTION
DBB	

### cAsUsualLayout(String, Int64, Int64, Int64)

Declaration

public DBB cAsUsualLayout(string LayoutStyle, long nRecords, long nRecordFLenBytes, long nRecordVLenBytes)

Parameters

ТУРЕ	NAME	DESCRIPTION
System.String	LayoutStyle	
System.Int64	nRecords	
System.Int64	nRecordFLenBytes	
System.Int64	nRecordVLenBytes	

Returns

ТУРЕ	DESCRIPTION
DBB	

### cAsUsualLayout(String, Int64, Int64, Int64, Int64)

Declaration

public DBB cAsUsualLayout(string LayoutStyle, long nLeadingBytes, long nRecords, long nRecordFLenBytes, long nRecordVLenBytes)

ТУРЕ	NAME	DESCRIPTION
System.String	LayoutStyle	

ТҮРЕ	NAME	DESCRIPTION
System.Int64	nLeadingBytes	
System.Int64	nRecords	
System.Int64	nRecordFLenBytes	
System.Int64	nRecordVLenBytes	

#### Returns

ТУРЕ	DESCRIPTION
DBB	

### cRead Existing Layout ()

Declaration

public DBB cReadExistingLayout()

#### Returns

ТҮРЕ	DESCRIPTION
DBB	

### cWith Length (Int 32)

Declaration

public DBB cWithLength(int length)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.int32	length	

#### Returns

ТҮРЕ	DESCRIPTION	
DBB		

### cWithOffset(Int32)

Declaration

public DBB cWithOffset(int offset)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	offset	

#### Returns

ТҮРЕ	DESCRIPTION
DBB	

### cWrap(ref Byte[], Int32, Boolean)

Declaration

public DBB cWrap(ref byte[] arg, int offset, bool bIsBigEndian)

#### Parameters

raiaillet	raialieteis		
TYPE		NAME	DESCRIPTION
Syster	m.Byte[]	arg	
Syster	m.Int32	offset	
Syster	m.Boolean	blsBigEndian	

### Returns

ТУРЕ	DESCRIPTION
DBB	

### cWrap(ref Byte[], Int32, Int32, Boolean)

Declaration

public DBB cWrap(ref byte[] arg, int offset, int length, bool bIsBigEndian)

ТҮРЕ	NAME	DESCRIPTION
System.Byte[]	arg	
System.Int32	offset	
System.Int32	length	
System.Boolean	blsBigEndian	

#### Returns

ТУРЕ	DESCRIPTION
DBB	

### Dispose()

Declaration

public void Dispose()

### Finalize()

Declaration

protected void Finalize()

### GetLayerByte(Int32)

Declaration

public byte GetLayerByte(int layer)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	

#### Returns

ТУРЕ	DESCRIPTION
System.Byte	

### GetLayerByteAt(Int32, Int64)

Declaration

public byte GetLayerByteAt(int layer, long arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	arg	

#### Returns

Returns	
ТҮРЕ	DESCRIPTION
System.Byte	

### ${\sf GetLayerDouble(Int32)}$

Declaration

public double? GetLayerDouble(int layer)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	

#### Returns

TYPE	DESCRIPTION
System.Nullable <system.double></system.double>	

## GetLayerDouble(Int32, Int64)

Declaration

public double? GetLayerDouble(int layer, long atarg)

#### arameter

qualificate.		
ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	

ТУРЕ	NAME	DESCRIPTION
System.Int64	atarg	

#### Returns

ТҮРЕ	DESCRIPTION
System.Nullable < System.Double >	

### ${\sf GetLayerFLenString(Int32,\,Int64)}$

Declaration

public string GetLayerFLenString(int layer, long nByteMaxLength)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	nByteMaxLength	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

### GetLayerFLenString(Int32, Int64, Int64)

Declaration

public string GetLayerFLenString(int layer, long atarg, long nByteMaxLength)

#### D - - - - - - - - - -

raidilleters			
	ТҮРЕ	NAME	DESCRIPTION
	System.Int32	layer	
	System.Int64	atarg	
	System.Int64	nByteMaxLength	

#### Returns

ТУРЕ	DESCRIPTION
System.String	

### GetLayerInt(Int32)

Declaration

public int? GetLayerInt(int layer)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	

#### Returns

Retuins	
ТҮРЕ	DESCRIPTION
System.Nullable < System.Int32 >	

### GetLayerInt(Int32, Int64)

Declaration

public int? GetLayerInt(int layer, long atarg)

#### Parameters

raianieters		
TYPE	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	

#### Returns

Returns		
	ТУРЕ	DESCRIPTION
	System.Nullable < System.Int32 >	

### GetLayerLong(Int32)

Declaration

public long? GetLayerLong(int layer)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	

### Returns

ТУРЕ	DESCRIPTION
System.Nullable <system.int64></system.int64>	

### GetLayerLong(Int32, Int64)

Declaration

public long? GetLayerLong(int layer, long atarg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	

#### Returns

ТҮРЕ		DESCRIPTION
System.Nullable	<system.int64></system.int64>	

### GetLayerVLenString(Int32, Int64)

Declaration

public string GetLayerVLenString(int layer, long nByteMaxLength)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	nByteMaxLength	

### Returns

ТУРЕ	DESCRIPTION
System.String	

### GetLayerVLenString(Int32, Int64, Int64)

Declaration

public string GetLayerVLenString(int layer, long atarg, long nByteMaxLength)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.Int64	nByteMaxLength	

### Returns

ТУРЕ	DESCRIPTION
System.String	

### isDirect()

Declaration

public bool isDirect()

### Returns

ТУРЕ	DESCRIPTION
System.Boolean	

### isValid()

Declaration

public bool isValid()

Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

### position(Int64, Int64, Int64)

Declaration

public void position(long ptr, long flenptr, long vlenptr)

Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int64	ptr	
System.Int64	flenptr	
System.Int64	vlenptr	

### PutLayerBytes(Int32, Byte[])

Declaration

public void PutLayerBytes(int layer, byte[] value)

Parameter

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Byte[]	value	

### PutLayerBytes(Int32, Int64, Byte[])

Declaration

public void PutLayerBytes(int layer, long atarg, byte[] value)

Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.Byte[]	value	

### PutLayerDouble(Int32, Double)

Declaration

public void PutLayerDouble(int layer, double value)

Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Double	value	

### PutLayerDouble(Int32, Int64, Double)

Declaration

public void PutLayerDouble(int layer, long atarg, double value)

Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.Double	value	

### PutLayerDouble(Int32, Int64, Object)

Declaration

public void PutLayerDouble(int layer, long atarg, object obj)

raidiffects		
ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	

ТҮРЕ	NAME	DESCRIPTION
System.Object	obj	

### PutLayerDouble(Int32, Object)

Declaration

public void PutLayerDouble(int layer, object obj)

Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Object	obj	

### PutLayerFLenString(Int32, Int64, String, Int32, Int32)

Declaration

public void PutLayerFLenString(int layer, long atarg, string value, int nByteMaxLength, int nZeroBytes)

Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.String	value	
System.Int32	nByteMaxLength	
System.Int32	nZeroBytes	

### PutLayerFLenString(Int32, String, Int32, Int32)

Declaration

public void PutLayerFLenString(int layer, string value, int nByteMaxLength, int nZeroBytes)

Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.String	value	
System.Int32	nByteMaxLength	
System.Int32	nZeroBytes	

### PutLayerInt(Int32, Int32)

Declaration

public void PutLayerInt(int layer, int value)

Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int32	value	

### PutLayerInt(Int32, Int64, Int32)

Declaration

public void PutLayerInt(int layer, long atarg, int value)

Parameter

Parameters		
ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.Int32	value	

### PutLayerInt(Int32, Int64, Object)

Declaration

public void PutLayerInt(int layer, long atarg, object obj)

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.Object	obj	

### PutLayerInt(Int32, Object)

Declaration

public void PutLayerInt(int layer, object obj)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Object	obj	

### PutLayerLong(Int32, Int64)

Declaration

public void PutLayerLong(int layer, long value)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	value	

### PutLayerLong(Int32, Int64, Int64)

Declaration

public void PutLayerLong(int layer, long atarg, long value)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.Int64	value	

### PutLayerLong(Int32, Int64, Object)

Declaration

public void PutLayerLong(int layer, long atarg, object obj)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.Object	obj	

### PutLayerLong(Int32, Object)

Declaration

public void PutLayerLong(int layer, object obj)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Object	obj	

### PutLayerVLenString(Int32, Int64, String, Int32, Int32)

Declaration

public void PutLayerVLenString(int layer, long atarg, string value, int nByteMaxLength, int nZeroBytes)

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	

ТУРЕ	NAME	DESCRIPTION
System.Int64	atarg	
System.String	value	
System.Int32	nByteMaxLength	
System.Int32	nZeroBytes	

### PutLayerVLenString(Int32, String, Int32, Int32)

Declaration

public void PutLayerVLenString(int layer, string value, int nByteMaxLength, int nZeroBytes)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.String	value	
System.Int32	nByteMaxLength	
System.Int32	nZeroBytes	

### PutLayerZeros(Int32, Int32)

Declaration

public void PutLayerZeros(int layer, int value)

#### Daramatar

ТУРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int32	value	

### PutLayerZeros(Int32, Int64, Int32)

Declaration

public void PutLayerZeros(int layer, long atarg, int value)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	layer	
System.Int64	atarg	
System.Int32	value	

### Reset()

Declaration

public void Reset()

## Wrap(ref Byte[])

Declaration

public DBB Wrap(ref byte[] arg)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Byte[]	arg	

#### Returns

ТҮРЕ	DESCRIPTION
DBB

Syntax

public class FieldMD : FieldBaseMD, FieldMDIKey<FieldName>

#### Constructors

#### FieldMD()

Declaration

public FieldMD()

## FieldMD(FieldMD)

Declaration

## public FieldMD(FieldMD arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMD	arg	

## Fields

## MapKey

Declaration

public FieldName MapKey

#### Field Value

ТҮРЕ	DESCRIPTION	
FieldName		

## Methods

## Copy(FieldMD)

Declaration

public void Copy(FieldMD arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMD	arg	

## Equals(FieldMD)

Declaration

public bool Equals(FieldMD arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMD	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## hasMapKey()

Declaration

public bool hasMapKey()

Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## MappedKey()

Declaration

public FieldName MappedKey()

#### Returns

ТҮРЕ	DESCRIPTION
FieldName	

## MappedKeyValue()

Declaration

public string MappedKeyValue()

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## MapToMapKey(FieldName)

Declaration

public void MapToMapKey(FieldName aFieldName)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldName	aFieldName	

## MapToMapKey(String)

Declaration

public FieldMD MapToMapKey(string aFieldStringName)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	aFieldStringName	

## Returns

ТҮРЕ	DESCRIPTION
FieldMD	

## Implements

FieldMDIKey<T>

## Methods

## AsInt(FieldMDEnums.eDTyp)

Declaration

public static int AsInt(this FieldMDEnums.eDTyp self)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## AsInt(FieldMDEnums.eRTyp)

Declaration

public static int AsInt(this FieldMDEnums.eRTyp self)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eRTyp	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## bln(FieldMDEnums.eDTyp, FieldMDEnums.eDTyp[])

#### Declaration

public static bool bIn(this FieldMDEnums.eDTyp self, params FieldMDEnums.eDTyp[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	
FieldMDEnums.eDTyp[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## bln(FieldMDEnums.eRTyp, FieldMDEnums.eRTyp[])

Declaration

public static bool bIn(this FieldMDEnums.eRTyp self, params FieldMDEnums.eRTyp[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eRTyp	self	
FieldMDEnums.eRTyp[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## eDTyp\_AsInt(FieldMDEnums.eDTyp)

Declaration

public static int eDTyp\_AsInt(this FieldMDEnums.eDTyp self)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## eDTyp\_bIn(FieldMDEnums.eDTyp, FieldMDEnums.eDTyp[])

public static bool eDTyp\_bIn(this FieldMDEnums.eDTyp self, params FieldMDEnums.eDTyp[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	
FieldMDEnums.eDTyp[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## eDTyp\_FromAlias(String, ref Int32[])

Declaration

public static FieldMDEnums.eDTyp eDTyp\_FromAlias(string arg, ref int[] typl)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	
System.Int32[]	typl	

#### Returns

ТҮРЕ	DESCRIPTION
FieldMDEnums.eDTyp	

## eDTyp\_FromInt(Int32)

Declaration

public static FieldMDEnums.eDTyp eDTyp\_FromInt(int arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.Int32	arg	

#### Returns

ТҮРЕ	DESCRIPTION
FieldMDEnums.eDTyp	

## equals(FieldMDEnums.eDTyp, FieldMDEnums.eDTyp)

Declaration

public static bool equals(this FieldMDEnums.eDTyp self, FieldMDEnums.eDTyp arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	
FieldMDEnums.eDTyp	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## equals(FieldMDEnums.eRTyp, FieldMDEnums.eRTyp)

Declaration

public static bool equals(this FieldMDEnums.eRTyp self, FieldMDEnums.eRTyp arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eRTyp	self	
FieldMDEnums.eRTyp	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## eRTyp\_AsInt(FieldMDEnums.eRTyp)

Declaration

public static int eRTyp\_AsInt(this FieldMDEnums.eRTyp self)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eRTyp	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## eRTyp\_bIn(FieldMDEnums.eRTyp, FieldMDEnums.eRTyp[])

Declaration

public static bool eRTyp\_bIn(this FieldMDEnums.eRTyp self, params FieldMDEnums.eRTyp[] args)

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eRTyp	self	
FieldMDEnums.eRTyp[]	args	

ТҮРЕ	DESCRIPTION
System.Boolean	

## eRTyp\_FromAlias(String)

Declaration

public static FieldMDEnums.eRTyp eRTyp\_FromAlias(string arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

#### Returns

ТҮРЕ	DESCRIPTION
FieldMDEnums.eRTyp	

## eRTyp\_FromInt(Int32)

Declaration

public static FieldMDEnums.eRTyp eRTyp\_FromInt(int arg)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	arg	

#### Returns

ТҮРЕ	DESCRIPTION
FieldMDEnums.eRTyp	

## FromInt(FieldMDEnums.eDTyp, Int32)

Declaration

public static FieldMDEnums.eDTyp FromInt(this FieldMDEnums.eDTyp self, int arg)

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	

ТҮРЕ	NAME	DESCRIPTION
System.Int32	arg	

ТҮРЕ	DESCRIPTION
FieldMDEnums.eDTyp	

## FromInt(FieldMDEnums.eRTyp, Int32)

Declaration

public static FieldMDEnums.eRTyp FromInt(this FieldMDEnums.eRTyp self, int arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eRTyp	self	
System.Int32	arg	

#### Returns

ТҮРЕ		DESCRIPTION
FieldMDEnums.eRTy	р	

## isNumeric(FieldMDEnums.eDTyp)

Declaration

public static bool isNumeric(this FieldMDEnums.eDTyp self)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## isString(FieldMDEnums.eDTyp)

Declaration

public static bool isString(this FieldMDEnums.eDTyp self)

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	

ТҮРЕ	DESCRIPTION
System.Boolean	

## toString(FieldMDEnums.eDTyp)

#### Declaration

public static string toString(this FieldMDEnums.eDTyp self)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## toString(FieldMDEnums.eRTyp)

## Declaration

public static string toString(this FieldMDEnums.eRTyp self)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eRTyp	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

# Interface FieldMDIKey<T>

Namespace: com.WDataSci.JniPMML

Assembly: JniPMML-Cs.dll

Syntax

public	interface	FieldMDIKey <t></t>
PUDITE	Tireer race	1 TCTGIDTICE VIV

#### Type Parameters

NAME	DESCRIPTION
Т	

## Methods

## hasMapKey()

Declaration

bool hasMapKey()

## Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## MappedKey()

Declaration

T MappedKey()

#### Returns

ТУРЕ	DESCRIPTION
Т	

## MapToMapKey(T)

Declaration

void MapToMapKey(T arg)

#### **Parameters**

## Handle(String)

Declaration

public int Handle(string aTag)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	аТад	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## isHandle(Int32)

Declaration

public bool isHandle(int aHandle)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	aHandle	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## isTag(String)

Declaration

public bool isTag(string aTag)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	аТад	

Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## Remove(JniPMMLItem)

Declaration

public void Remove(JniPMMLItem arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
JniPMMLItem	arg	

## Remove(Int32)

Declaration

public void Remove(int aHandle)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	aHandle	

## Remove(String)

Declaration

public void Remove(string aTag)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	аТад	

## Tag(Int32)

Declaration

public string Tag(int aHandle)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	aHandle	

## Returns

ТҮРЕ	DESCRIPTION
System.String	

## TryGetObject(Int32, out JniPMMLItem)

Declaration

## public bool TryGetObject(int aHandle, out JniPMMLItem value)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	aHandle	
JniPMMLItem	value	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## TryGetObject(String, out JniPMMLItem)

Declaration

public bool TryGetObject(string aTag, out JniPMMLItem value)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	аТад	
JniPMMLItem	value	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## **Extension Methods**

JavaLikeExtensions.toString(Object)

## Class JniPMMLItem

The JniPMMLItem class is mirrored on the C# and Java sides, but with a few specific differences: On the C# side, JniPMMLItem also works as an IExcelObservable object handle, while also holding the information needed to pass data to Java. The handle storage is effectively handled on the Java side.

Inheritance

System.Object

**JniPMMLItem** 

**Implements** 

 ${\it ExcelDna.} Integration. I {\it ExcelObservable}$ 

System.IDisposable

Inherited Members

System.Object.ToString()

System.Object.Equals(System.Object)

System.Object.Equals(System.Object, System.Object)

### mReadRecordSet(RecordSetMD)

Declaration

public RecordSet mReadRecordSet(RecordSetMD aRecordSetMD)

### Parameters

ТУРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	

### Returns

ТҮРЕ	DESCRIPTION
RecordSet	

# mWriteRecordSet(RecordSetMD, RecordSetMD, RecordSet)

Declaration

public RecordSet mWriteRecordSet(RecordSetMD aOutputRecordSetMD, RecordSetMD aInputRecordSetMD, RecordSet
aInputRecordSet)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aOutputRecordSetMD	
RecordSetMD	aInputRecordSetMD	
RecordSet	alnputRecordSet	

Returns

ТҮР	PE	DESCRIPTION
Rec	cordSet	

# **Extension Methods**

# Class RecordSetMD

Inheritance

Namespace: com.WDataSci.JniPMML

Assembly: JniPMML-Cs.dll

Syntax

public class RecordSetMD

### Constructors

### RecordSetMD(RecordSetMDEnums.eMode)

Declaration

public RecordSetMD(RecordSetMDEnums.eMode arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eMode	arg	

### Fields

### Column

Declaration

public FieldMD[] Column

### Field Value

ТҮРЕ	DESCRIPTION
FieldMD[]	

# DBBMatter

Declaration

public WranglerDBB DBBMatter

# Field Value

ТУРЕ	DESCRIPTION
WranglerDBB	

# Default Header Max String Byte Length

Declaration

public static long DefaultHeaderMaxStringByteLength

Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

# Default Header Max String Length

Declaration

public static long DefaultHeaderMaxStringLength

Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

# Default Max String By te Length

Declaration

public static long DefaultMaxStringByteLength

Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

# DefaultMaxStringLength

Declaration

public static long DefaultMaxStringLength

Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

### FileMatter

Declaration

public WranglerFlatFile FileMatter

Field Value

ТҮРЕ	DESCRIPTION
WranglerFlatFile	

#### Declaration

public WranglerHDF5 HDF5Matter

Field Value

ТҮРЕ	DESCRIPTION
WranglerHDF5	

# Mode

Declaration

public RecordSetMDEnums.eMode Mode

Field Value

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eMode	

# ModeMatter

Declaration

public RecordSetMD.\_\_ModeMatter ModeMatter

Field Value

ТҮРЕ	DESCRIPTION
RecordSetMDModeMatter	

### SchemaMatter

Declaration

 ${\color{blue} \textbf{public}} \ \ \textbf{RecordSetMD.} \underline{\hspace{0.5cm}} \textbf{SchemaMatter} \ \ \textbf{SchemaMatter}$ 

Field Value

ТҮРЕ	DESCRIPTION
RecordSetMDSchemaMatter	

# SchemaType

Declaration

public RecordSetMDEnums.eSchemaType SchemaType

Field Value

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eSchemaType	

# Туре

Declaration

### public RecordSetMDEnums.eType Type

### Field Value

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eType	

### Methods

# cAs(RecordSetMDEnums.eType)

Declaration

public RecordSetMD cAs(RecordSetMDEnums.eType arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	arg	

#### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# $cAs (Record Set MDE nums. eType,\ Record Set MDE nums. eSchema Type)$

Declaration

public RecordSetMD cAs(RecordSetMDEnums.eType arg, RecordSetMDEnums.eSchemaType schema)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	arg	
RecordSetMDEnums.eSchemaType	schema	

# Returns

Т	<b>УРЕ</b>	DESCRIPTION
R	decordSetMD	

# $cAs (Record Set MDE nums. eType,\ Record Set MDE nums. eSchema Type,\ Boolean,\ String)$

Declaration

public RecordSetMD cAs(RecordSetMDEnums.eType arg, RecordSetMDEnums.eSchemaType schema, bool isFileName, string schemadetails)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	arg	

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eSchemaType	schema	
System.Boolean	isFileName	
System.String	schemadetails	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cAsDImFile(String)

Declaration

public RecordSetMD cAsDlmFile(string aFileName)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	aFileName	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cAsDImFile(String, String)

Declaration

public RecordSetMD cAsDlmFile(string aFileName, string dlm)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	aFileName	
System.String	dlm	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cFromFile(String)

Declaration

public RecordSetMD cFromFile(string aFileName)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	aFileName	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cRepeatInputSet()

Declaration

public RecordSetMD cRepeatInputSet()

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cRepeatInputSetWithSuffix (String)

Declaration

public RecordSetMD cRepeatInputSetWithSuffix(string aInputFieldSuffix)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	aInputFieldSuffix	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# $cRepeatInputSetWithSuffix (String, \ String)$

Declaration

 $public \ RecordSetMD \ cRepeatInputSetWithSuffix (string \ aInputFieldSuffix, \ string \ aCompositeFieldNameDlm)$ 

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	alnputFieldSuffix	
System.String	aCompositeFieldNameDIm	

Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cSetHeaderBufferAs(DBB, Int32, Int32, Int32)

Declaration

public RecordSetMD cSetHeaderBufferAs(DBB arg, int nRecords, int nRecordCoreLength, int nRecordVariableLength)

### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	
System.Int32	nRecords	
System.Int32	nRecordCoreLength	
System.Int32	nRecordVariableLength	

#### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

### cSetHeaderBufferFrom(DBB)

Declaration

public RecordSetMD cSetHeaderBufferFrom(DBB arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cSetRecordSetBufferAs(DBB)

Declaration

public RecordSetMD cSetRecordSetBufferAs(DBB arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	

Returns

ТУРЕ	DESCRIPTION
RecordSetMD	

# cSetRecordSetBufferAs(DBB, Int64, Int64, Int64, Int64, Int64)

Declaration

public RecordSetMD cSetRecordSetBufferAs(DBB arg, long nRecords, long nRecordCoreLength, long
nRecordVariableLength, long nCoreLength, long nTotalLength)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	
System.Int64	nRecords	
System.Int64	nRecordCoreLength	
System.Int64	nRecordVariableLength	
System.Int64	nCoreLength	
System.Int64	nTotalLength	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cSetRecordSetBufferFrom(DBB)

Declaration

public RecordSetMD cSetRecordSetBufferFrom(DBB arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	

#### Returns

ТУРЕ	DESCRIPTION
RecordSetMD	

# cToFile(String)

Declaration

public RecordSetMD cToFile(string aFileName)

Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	aFileName	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cWith Composite Field Name Dlm (String)

Declaration

public RecordSetMD cWithCompositeFieldNameDlm(string aCompositeFieldNameDlm)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	aCompositeFieldNameDlm	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# $cWith {\tt DataSetName} (String)$

Declaration

public RecordSetMD cWithDataSetName(string arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cWithDelimiter(String)

Declaration

public RecordSetMD cWithDelimiter(string arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cWithDlm(String)

Declaration

public RecordSetMD cWithDlm(string arg)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.String	arg	

# Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cWithHeaderRow()

Declaration

public RecordSetMD cWithHeaderRow()

# Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cWithOutRepeatInputSet()

Declaration

public RecordSetMD cWithOutRepeatInputSet()

# Returns

ТУРЕ	DESCRIPTION
RecordSetMD	

# cWith Record Element Name (String)

Declaration

public RecordSetMD cWithRecordElementName(string arg)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# $cWith Record Set And Record Element Names (String, \ String)\\$

Declaration

public RecordSetMD cWithRecordSetAndRecordElementNames(string arg, string arg1)

### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	
System.String	arg1	

#### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# cWith Record Set Element Name (String)

Declaration

public RecordSetMD cWithRecordSetElementName(string arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# Dispose()

Declaration

public void Dispose()

# Equals(RecordSetMD, Boolean)

Declaration

public bool Equals(RecordSetMD arg, bool bIgnoreMode)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	arg	

ТҮРЕ	NAME	DESCRIPTION
System.Boolean	blgnoreMode	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

### Finalize()

Declaration

protected void Finalize()

### isModeValid()

Declaration

public bool isModeValid()

### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

# mBytesRequired(Int64, out Int64, out Int64)

Declaration

public void mBytesRequired(long nRecords, out long rsize, out long rflensize, out long rvlensize)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int64	nRecords	
System.Int64	rsize	
System.Int64	rflensize	
System.Int64	rvlensize	

mBytesRequired(Int64, out Int64, out Int64,

Declaration

public void mBytesRequired(long nRecords, out long csize, out long hsize, out long rsize, out long cleadsize, out long hleadsize, out long hleadsize, out long rleadsize, out long rflensize, out long rvlensize)

### Parameters

ТҮРЕ	NAME	DESCRIPTION

ТҮРЕ	NAME	DESCRIPTION
System.Int64	nRecords	
System.Int64	csize	
System.Int64	hsize	
System.Int64	rsize	
System.Int64	cleadsize	
System.Int64	hleadsize	
System.Int64	hflensize	
System.Int64	hvlensize	
System.Int64	rleadsize	
System.Int64	rflensize	
System.Int64	rvlensize	

# m Column Consistency ()

Declaration

public RecordSetMD mColumnConsistency()

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# ${\tt mCopyColumnsFrom(RecordSetMD)}$

Declaration

public RecordSetMD mCopyColumnsFrom(RecordSetMD arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	arg	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

mPrepForOutput < T > (RecordSetMD, JniPMMLItem, List < Map < T, Object >>)

Declaration

public RecordSetMD mPrepForOutput<T>(RecordSetMD aInputRecordSetMD, JniPMMLItem aJniPMML, List<Map<T, object>>
Results)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aInputRecordSetMD	
JniPMMLItem	aJniPMML	
System.Collections.Generic.List < Map < T, System.Object > >	Results	

#### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# Type Parameters

NAME	DESCRIPTION
Т	

# mReadMapFor(JniPMMLItem, PrintWriter, Boolean)

Declaration

public RecordSetMD mReadMapFor(JniPMMLItem aJniPMMLItem, PrintWriter pw, bool bFillDictionaryNames)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
JniPMMLItem	aJniPMMLItem	
PrintWriter	pw	
System.Boolean	bFillDictionaryNames	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

# mUpdateWithPMMLSchema(JniPMMLItem)

Declaration

public void mUpdateWithPMMLSchema(JniPMMLItem aJniPMML)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
JniPMMLItem	aJniPMML	

# mWriteMapToBuffer()

Declaration

public int mWriteMapToBuffer()

Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# mWritePrepFor(Int32)

Declaration

public RecordSetMD mWritePrepFor(int nRows)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	nRows	

### Returns

ТҮРЕ	DESCRIPTION
RecordSetMD	

### nColumns()

Declaration

public int nColumns()

### Returns

ТҮРЕ		DESCRIPTION
System.Int3	2	

# n Columns (Field MDE nums.eRTyp)

Declaration

public int nColumns(FieldMDEnums.eRTyp arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eRTyp	arg	

### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# n Header Byte Max Length ()

### Declaration

public	long	nHeaderByteMaxLength()
Public	TOLIE	TITICAUCT Dy CCHARLCIIG CIT

# Returns

ТҮРЕ	DESCRIPTION
System.Int64	

# n Header String Max Length ()

# Declaration

public long nHeaderStringMaxLength()

# Returns

ТҮРЕ	DESCRIPTION
System.Int64	

# **Extension Methods**

### Methods

### AsInt(RecordSetMDEnums.eMode)

Declaration

public static int AsInt(this RecordSetMDEnums.eMode self)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eMode	self	

### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# AsInt(RecordSetMDEnums.eSchemaType)

Declaration

public static int AsInt(this RecordSetMDEnums.eSchemaType self)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eSchemaType	self	

### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## AsInt(RecordSetMDEnums.eType)

Declaration

|--|

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## bln(RecordSetMDEnums.eMode, RecordSetMDEnums.eMode[])

Declaration

public static bool bIn(this RecordSetMDEnums.eMode self, params RecordSetMDEnums.eMode[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eMode	self	
RecordSetMDEnums.eMode[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## bln(RecordSetMDEnums.eMode, String[])

Declaration

public static bool bIn(this RecordSetMDEnums.eMode self, params string[] args)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eMode	self	
System.String[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

 $bln(RecordSetMDEnums.eSchemaType,\ RecordSetMDEnums.eSchemaType[])$ 

Declaration

public static bool bIn(this RecordSetMDEnums.eSchemaType self, params RecordSetMDEnums.eSchemaType[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eSchemaType	self	
RecordSetMDEnums.eSchemaType[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## bln(RecordSetMDEnums.eSchemaType, String[])

Declaration

public static bool bIn(this RecordSetMDEnums.eSchemaType self, params string[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eSchemaType	self	
System.String[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## bln(RecordSetMDEnums.eType, RecordSetMDEnums.eType[])

Declaration

public static bool bIn(this RecordSetMDEnums.eType self, params RecordSetMDEnums.eType[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	self	
RecordSetMDEnums.eType[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## bln(RecordSetMDEnums.eType, String[])

Declaration

public static bool bIn(this RecordSetMDEnums.eType self, params string[] args)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	self	
System.String[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## eMode\_FromAlias(String)

Declaration

public static RecordSetMDEnums.eMode eMode\_FromAlias(string arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

#### Returns

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eMode	

## eMode\_FromInt(Int32)

Declaration

public static RecordSetMDEnums.eMode eMode\_FromInt(int arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	arg	

#### Returns

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eMode	

## $equals (Record Set MDE nums. eMode,\ Record Set MDE nums. eMode)$

Declaration

public static bool equals(this RecordSetMDEnums.eMode self, RecordSetMDEnums.eMode arg)

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eMode	self	
RecordSetMDEnums.eMode	arg	

ТҮРЕ	DESCRIPTION
System.Boolean	

## $equals (Record Set MDE nums. eSchema Type, \ Record Set MDE nums. eSchema Type)$

Declaration

public static bool equals(this RecordSetMDEnums.eSchemaType self, RecordSetMDEnums.eSchemaType arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eSchemaType	self	
RecordSetMDEnums.eSchemaType	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## $equals (Record Set MDE nums. eType,\ Record Set MDE nums. eType)$

Declaration

public static bool equals(this RecordSetMDEnums.eType self, RecordSetMDEnums.eType arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	self	
RecordSetMDEnums.eType	arg	

### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## $eSchemaType\_FromAlias(String)\\$

Declaration

public static RecordSetMDEnums.eSchemaType eSchemaType\_FromAlias(string arg)

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eSchemaType	

## eSchemaType\_FromInt(Int32)

Declaration

public static RecordSetMDEnums.eSchemaType eSchemaType\_FromInt(int arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	arg	

#### Returns

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eSchemaType	

## eType\_FromAlias(String)

Declaration

public static RecordSetMDEnums.eType eType\_FromAlias(string arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

#### Returns

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eType	

## eType\_FromInt(Int32)

Declaration

public static RecordSetMDEnums.eType eType\_FromInt(int arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	arg	

ТҮРЕ	DESCRIPTION
RecordSetMDEnums.eType	

## is Flat File (Record Set MDE nums. eType)

Declaration

public static bool isFlatFile(this RecordSetMDEnums.eType self)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	self	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## to String (Record Set MDE nums. eSchema Type)

Declaration

public static string toString(this RecordSetMDEnums.eSchemaType self)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eSchemaType	self	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

## to String (Record Set MDE nums. eType)

Declaration

public static string toString(this RecordSetMDEnums.eType self)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMDEnums.eType	self	

ТҮРЕ	DESCRIPTION
System.String

#### RecordSetElementName(XmlDocument)

Declaration

public static string RecordSetElementName(XmlDocument xInputSchema)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Xml.XmlDocument	xInputSchema	

#### Returns

ТУРЕ	DESCRIPTION
System.String	

## RecordSingleName(String)

Declaration

public static string RecordSingleName(string arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

ТҮРЕ	DESCRIPTION
System.String	

## **Extension Methods**

JavaLikeExtensions.toString(Object)

# Class WranglerDBB

Inheritance

System.Object

WranglerDBB

Inherited Members

System.Object.ToString()

System.Object.Equals(System.Object)

System.Object.Equals(System.Object, System.Object)

System.Object.ReferenceEquals(System.Object, System.Object)

System.Object.GetHashCode()

System.Object.GetType()

System.Object.MemberwiseClone()

Namespace: com.WDataSci.JniPMML

Assembly: JniPMML-Cs.dll

Syntax

public class WranglerDBB

#### Constructors

#### WranglerDBB()

Declaration

public WranglerDBB()

#### Fields

#### Header

Declaration

public WranglerDBB.\_\_DBBMatter Header

Field Value

ТҮРЕ	DESCRIPTION
WranglerDBBDBBMatter	

#### RecordSet

Declaration

public WranglerDBB.\_\_DBBMatter RecordSet

Field Value

ТҮРЕ	DESCRIPTION
WranglerDBBDBBMatter	

#### Methods

cSetHeaderBufferAs(DBB, Int32, Int32, Int32)

Declaration

public WranglerDBB cSetHeaderBufferAs(DBB arg, int nRecords, int nRecordCoreLength, int nRecordVariableLength)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	
System.Int32	nRecords	
System.Int32	nRecordCoreLength	
System.Int32	nRecordVariableLength	

#### Returns

	ТҮРЕ	DESCRIPTION
,	WranglerDBB	

## cSetHeaderBufferFrom(DBB)

Declaration

public WranglerDBB cSetHeaderBufferFrom(DBB arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	

#### Returns

ТҮРЕ	DESCRIPTION
WranglerDBB	

## cSetRecordSetBufferAs(DBB)

Declaration

public WranglerDBB cSetRecordSetBufferAs(DBB arg)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	

#### Returns

ТҮРЕ	DESCRIPTION
WranglerDBB	

cSetRecordSetBufferAs(DBB, Int64, Int64, Int64, Int64, Int64)

Declaration

public WranglerDBB cSetRecordSetBufferAs(DBB arg, long nRecords, long nRecordCoreLength, long
nRecordVariableLength, long nCoreLength, long nTotalLength)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
DBB	arg	
System.Int64	nRecords	
System.Int64	nRecordCoreLength	
System.Int64	nRecordVariableLength	
System.Int64	nCoreLength	
System.Int64	nTotalLength	

#### Returns

ТҮРЕ	DESCRIPTION
WranglerDBB	

#### cSetRecordSetBufferFrom(DBB)

Declaration

public WranglerDBB cSetRecordSetBufferFrom(DBB arg)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
DBB	arg	

## Returns

ТҮРЕ	DESCRIPTION
WranglerDBB	

## Dispose()

Declaration

public void Dispose()

## Finalize()

Declaration

protected void Finalize()

## isValid()

Declaration

public bool isValid()

ТҮРЕ	DESCRIPTION
System.Boolean	

## mBytesRequired(RecordSetMD, Int64, out Int64, out Int64, out Int64)

## Declaration

public void mBytesRequired(RecordSetMD aRecordSetMD, long nRecords, out long rsize, out long rflensize, out long rvlensize)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
System.Int64	nRecords	
System.Int64	rsize	
System.Int64	rflensize	
System.Int64	rvlensize	

mBytesRequired(RecordSetMD, Int64, out Int64

#### Declaration

public void mBytesRequired(RecordSetMD aRecordSetMD, long nRecords, out long csize, out long hsize, out long rsize, out long cleadsize, out long hleadsize, out long hflensize, out long rleadsize, out long rflensize, out long rvlensize)

raidiffeters		
ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
System.Int64	nRecords	
System.Int64	csize	
System.Int64	hsize	
System.Int64	rsize	
System.Int64	cleadsize	
System.Int64	hleadsize	
System.Int64	hflensize	

ТҮРЕ	NAME	DESCRIPTION
System.Int64	hvlensize	
System.Int64	rleadsize	
System.Int64	rflensize	
System.Int64	rvlensize	

## mReadMap(RecordSetMD, JniPMMLItem, PrintWriter, Boolean)

Declaration

public void mReadMap(RecordSetMD aRecordSetMD, JniPMMLItem aJniPMML, PrintWriter pw, bool bFillDictionaryNames)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
JniPMMLItem	aJniPMML	
PrintWriter	pw	
System.Boolean	bFillDictionaryNames	

## mReadRecordSet(RecordSetMD, RecordSet, PrintWriter)

Declaration

public void mReadRecordSet(RecordSetMD aInputRecordSetMD, RecordSet aInputRecordSet, PrintWriter pw)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aInputRecordSetMD	
RecordSet	aInputRecordSet	
PrintWriter	pw	

## mWriteMap(RecordSetMD)

Declaration

public int mWriteMap(RecordSetMD aRecordSetMD)

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	

ТҮРЕ	DESCRIPTION
System.Int32	

## mWritePrepFor(RecordSetMD, Int64)

Declaration

public void mWritePrepFor(RecordSetMD aRecordSetMD, long nRecords)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
System.Int64	nRecords	

## mWriteRecordSet(RecordSetMD, RecordSet, RecordSetMD, RecordSet)

Declaration

public int mWriteRecordSet(RecordSetMD outRecordSetMD, RecordSet aOutputRecordSet, RecordSetMD inRecordSetMD,
RecordSet aInputRecordSet)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	outRecordSetMD	
RecordSet	aOutputRecordSet	
RecordSetMD	inRecordSetMD	
RecordSet	alnputRecordSet	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## $mWriteRecordSet(RecordSetMD,\ ListObject)$

Declaration

public int mWriteRecordSet(RecordSetMD inRecordSetMD, ListObject aListObject)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	inRecordSetMD	
Microsoft.Office.Interop.Excel.ListObject	aListObject	

ТУРЕ	DESCRIPTION
System.Int32	

## mWriteRecordSet(RecordSetMD, Object[,], Boolean)

#### Declaration

public int mWriteRecordSet(RecordSetMD inRecordSetMD, object[, ] r, bool bIncludesHeaderRow)

## Parameters

ТУРЕ	NAME	DESCRIPTION
RecordSetMD	inRecordSetMD	
System.Object[,]	r	
System.Boolean	bIncludesHeaderRow	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## **Extension Methods**

JavaLikeExtensions.toString(Object)

# Class WranglerDBB.\_\_DBBMatter

Inheritance

System.Object

WranglerDBB.\_\_DBBMatter

Inherited Members

System.Object.ToString()

System.Object.Equals(System.Object)

System.Object.Equals(System.Object, System.Object)

System.Object.ReferenceEquals(System.Object, System.Object)

System. Object. Get Hash Code ()

System.Object.GetType()

System.Object.MemberwiseClone()

Namespace: com.WDataSci.JniPMML

Assembly: JniPMML-Cs.dll

Syntax

public class \_\_DBBMatter

#### Fields

## blsManagedInJava

Declaration

public bool bIsManagedInJava

#### Field Value

ТҮРЕ	DESCRIPTION
System.Boolean	

### Buffer

Declaration

public DBB Buffer

#### Field Value

ТҮРЕ	DESCRIPTION
DBB	

## MaxStringByteLength

Declaration

public long MaxStringByteLength

#### Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

#### Declaration

public long MaxStringLength

Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

## Methods

Dispose()

Declaration

public void Dispose()

## Finalize()

Declaration

protected void Finalize()

## **Extension Methods**

JavaLikeExtensions.toString(Object)

# Class WranglerFlatFile

Inheritance

System.Object

WranglerFlatFile

Inherited Members

System.Object.ToString()

System.Object.Equals(System.Object)

System.Object.Equals(System.Object, System.Object)

System.Object.ReferenceEquals(System.Object, System.Object)

System.Object.GetHashCode()

System.Object.GetType()

System.Object.MemberwiseClone()

Namespace: com.WDataSci.JniPMML

Assembly: JniPMML-Cs.dll

Syntax

public class WranglerFlatFile

#### Fields

CSV

Declaration

public CsvParser \_\_CSV

Field Value

ТҮРЕ	DESCRIPTION
CsvHelper.CsvParser	

## \_\_StreamReader

Declaration

public StreamReader \_\_StreamReader

Field Value

ТҮРЕ	DESCRIPTION
System.IO.StreamReader	

#### Dlm

Declaration

public string Dlm

#### Field Value

ТҮРЕ	DESCRIPTION
System.String	

#### FileName

#### Declaration

public string FileName

#### Field Value

ТҮРЕ	DESCRIPTION
System.String	

## has Header Row

Declaration

public bool hasHeaderRow

#### Field Value

ТҮРЕ	DESCRIPTION
System.Boolean	

#### Path

Declaration

public string Path

#### Field Value

ТҮРЕ	DESCRIPTION
System.String	

#### Methods

cPointToFile(RecordSetMD, String, Boolean, String)

Declaration

public void cPointToFile(RecordSetMD aInputRecordSetMD, string aFileName, bool hasHeaderRow, string dlm)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aInputRecordSetMD	
System.String	aFileName	
System.Boolean	hasHeaderRow	
System.String	dlm	

## cPointToFile(RecordSetMD, String, String, Boolean, String)

Declaration

public void cPointToFile(RecordSetMD aInputRecordSetMD, string aPath, string aFileName, bool hasHeaderRow, string dlm)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	alnputRecordSetMD	
System.String	aPath	
System.String	aFileName	
System.Boolean	hasHeaderRow	
System.String	dlm	

## Dispose()

Declaration

public void Dispose()

## Equals (Wrangler Flat File)

Declaration

public bool Equals(WranglerFlatFile arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
WranglerFlatFile	arg	

#### Returns

TYPE		DESCRIPTION
Syste	em.Boolean	

#### Finalize()

Declaration

protected void Finalize()

## mReadMapFor(RecordSetMD, JniPMMLItem, PrintWriter, Boolean)

Declaration

public void mReadMapFor(RecordSetMD aRecordSetMD, JniPMMLItem aJniPMML, PrintWriter pw, bool bFillDictionaryNames)

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
JniPMMLItem	aJniPMML	
PrintWriter	pw	

ТҮРЕ	NAME	DESCRIPTION
System.Boolean	bFillDictionaryNames	

## mReadRecordSet(RecordSetMD, RecordSet, PrintWriter)

Declaration

public void mReadRecordSet(RecordSetMD aInputRecordSetMD, RecordSet aInputRecordSet, PrintWriter pw)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	alnputRecordSetMD	
RecordSet	alnputRecordSet	
PrintWriter	pw	

## mReadRecordSet(RecordSetMD, RecordSet, String, String, Boolean, String, PrintWriter)

Declaration

public void mReadRecordSet(RecordSetMD aInputRecordSetMD, RecordSet aInputRecordSet, string aPath, string
aFileName, bool hasHeaderRow, string dlm, PrintWriter pw)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	alnputRecordSetMD	
RecordSet	alnputRecordSet	
System.String	aPath	
System.String	aFileName	
System.Boolean	hasHeaderRow	
System.String	dlm	
PrintWriter	pw	

## mWriteRecordSet(RecordSetMD, RecordSet)

Declaration

public void mWriteRecordSet(RecordSetMD aOutputRecordSetMD, RecordSet aOutputRecordSet)

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aOutputRecordSetMD	

ТҮРЕ	NAME	DESCRIPTION
RecordSet	aOutputRecordSet	

## mWriteRecordSet(RecordSetMD, RecordSet, RecordSetMD, RecordSet)

#### Declaration

public void mWriteRecordSet(RecordSetMD aOutputRecordSetMD, RecordSet aOutputRecordSet, RecordSetMD aInputRecordSetMD, RecordSet aInputRecordSet)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aOutputRecordSetMD	
RecordSet	aOutputRecordSet	
RecordSetMD	aInputRecordSetMD	
RecordSet	alnputRecordSet	

## mWriteRecordSet(RecordSetMD, ListObject)

Declaration

public void mWriteRecordSet(RecordSetMD aOutputRecordSetMD, ListObject aListObject)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aOutputRecordSetMD	
Microsoft.Office.Interop.Excel.ListObject	aListObject	

## **Extension Methods**

JavaLikeExtensions.toString(Object)

# Class WranglerHDF5

Inheritance

System.Object

WranglerHDF5

Inherited Members

System.Object.ToString()

System.Object.Equals(System.Object)

System.Object.Equals(System.Object, System.Object)

System.Object.ReferenceEquals(System.Object, System.Object)

System.Object.GetHashCode()

System.Object.GetType()

System.Object.MemberwiseClone()

Namespace: com.WDataSci.JniPMML

Assembly: JniPMML-Cs.dll

Syntax

public class WranglerHDF5

#### Constructors

#### WranglerHDF5()

Declaration

public WranglerHDF5()

#### Fields

#### blsInMemory

Declaration

public bool bIsInMemory

Field Value

ТҮРЕ	DESCRIPTION
System.Boolean	

## CompoundDS

Declaration

public long CompoundDS

Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

## DSName

Declaration

public string DSName

#### Field Value

ТҮРЕ	DESCRIPTION
System.String	

#### File

Declaration

public long File

#### Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

## Methods

## Dispose()

Declaration

public void Dispose()

#### Finalize()

Declaration

protected void Finalize()

## mReadMapFor(RecordSetMD, JniPMMLItem, PrintWriter, Boolean)

Declaration

public void mReadMapFor(RecordSetMD aRecordSetMD, JniPMMLItem aJniPMML, PrintWriter pw, bool bFillDictionaryNames)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
JniPMMLItem	aJniPMML	
PrintWriter	pw	
System.Boolean	bFillDictionaryNames	

## mReadPrepFor(RecordSetMD, PrintWriter)

Declaration

public long mReadPrepFor(RecordSetMD aRecordSetMD, PrintWriter pw)

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
PrintWriter	pw	

ТҮРЕ	DESCRIPTION
System.Int64	

## $mReadRecordSet(RecordSetMD,\,RecordSet,\,PrintWriter)$

Declaration

public void mReadRecordSet(RecordSetMD aInputRecordSetMD, RecordSet aInputRecordSet, PrintWriter pw)

#### **Parameters**

ТУРЕ	NAME	DESCRIPTION
RecordSetMD	alnputRecordSetMD	
RecordSet	alnputRecordSet	
PrintWriter	pw	

## mWriteMap(RecordSetMD)

Declaration

public int mWriteMap(RecordSetMD aRecordSetMD)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## mWritePrepFor(RecordSetMD, PrintWriter)

Declaration

public long mWritePrepFor(RecordSetMD aRecordSetMD, PrintWriter pw)

RecordSetMD aRecordSetMD	ТҮРЕ	NAME	DESCRIPTION
	RecordSetMD	aRecordSetMD	

ТУРЕ	NAME	DESCRIPTION
PrintWriter	pw	

ТҮРЕ	DESCRIPTION
System.Int64	

## mWriteRecordSet(RecordSetMD, RecordSet, RecordSetMD, RecordSet)

Declaration

public void mWriteRecordSet(RecordSetMD aOutputRecordSetMD, RecordSet aOutputRecordSet, RecordSetMD aInputRecordSetMD, RecordSet aInputRecordSet)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aOutputRecordSetMD	
RecordSet	aOutputRecordSet	
RecordSetMD	aInputRecordSetMD	
RecordSet	alnputRecordSet	

## mWriteRecordSet(RecordSetMD, ListObject)

Declaration

public int mWriteRecordSet(RecordSetMD aRecordSetMD, ListObject aListObject)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
Microsoft.Office.Interop.Excel.ListObject	aListObject	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## new\_HDF5DataType(FieldMDEnums.eDTyp)

Declaration

public WranglerHDF5.HDF5DataType new\_HDF5DataType(FieldMDEnums.eDTyp DTyp)

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	DТур	

ТҮРЕ	DESCRIPTION
WranglerHDF5.HDF5DataType	

## new\_HDF5DataType(FieldMDEnums.eDTyp, Int64, Boolean)

Declaration

public WranglerHDF5.HDF5DataType new\_HDF5DataType(FieldMDEnums.eDTyp DTyp, long nStringMaxLength, bool anyVLen)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	DТур	
System.Int64	nStringMaxLength	
System.Boolean	anyVLen	

#### Returns

ТҮРЕ	DESCRIPTION
WranglerHDF5.HDF5DataType	

## $new\_HDF5DataType(WranglerHDF5.HDF5DataType)$

Declaration

public WranglerHDF5.HDF5DataType new\_HDF5DataType(WranglerHDF5.HDF5DataType arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
WranglerHDF5.HDF5DataType	arg	

#### Returns

ТҮРЕ	DESCRIPTION
WranglerHDF5.HDF5DataType	

## new\_HDF5DataType(Int32, Int32, Int32, Int32)

Declaration

public WranglerHDF5.HDF5DataType new\_HDF5DataType(int hclass, int hlength, int horder, int hsign)

ТҮРЕ	NAME	DESCRIPTION
System.Int32	hclass	
System.Int32	hlength	
System.Int32	horder	
System.Int32	hsign	

ТҮРЕ	DESCRIPTION
WranglerHDF5.HDF5DataType	

## new\_HDF5DataType(Int64)

Declaration

public WranglerHDF5.HDF5DataType new\_HDF5DataType(long arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.Int64	arg	

#### Returns

ТҮРЕ	DESCRIPTION
WranglerHDF5.HDF5DataType	

## $Update Output Map For HDF5 (Record Set MD,\ Print Writer)$

Declaration

public void UpdateOutputMapForHDF5(RecordSetMD aRecordSetMD, PrintWriter pw)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
PrintWriter	pw	

## **Extension Methods**

JavaLikeExtensions.toString(Object)

# Class WranglerHDF5.HDF5DataType

Inheritance

System.Object

WranglerHDF5.HDF5DataType

Inherited Members

System.Object.ToString()

System.Object.Equals(System.Object)

System.Object.Equals(System.Object, System.Object)

System.Object.ReferenceEquals(System.Object, System.Object)

System.Object.GetHashCode()

System.Object.GetType()

System.Object.MemberwiseClone()

Namespace: com.WDataSci.JniPMML

Assembly: JniPMML-Cs.dll

Syntax

public class HDF5DataType

## Constructors

## HDF5DataType(FieldMDEnums.eDTyp, Int64, Boolean)

Declaration

public HDF5DataType(FieldMDEnums.eDTyp DTyp, long nStringMaxLength, bool anyVLen)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
FieldMDEnums.eDTyp	DТур	
System.Int64	nStringMaxLength	
System.Boolean	anyVLen	

## HDF5DataType(Int64)

Declaration

public HDF5DataType(long arg)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int64	arg	

## HDF5DataType(Int64, Int32, Int32, Int32)

Declaration

public HDF5DataType(long hclass, int hlength, int horder, int hsign)

ТҮРЕ	NAME	DESCRIPTION
System.Int64	hclass	
System.Int32	hlength	
System.Int32	horder	
System.Int32	hsign	

## Fields

#### data

Declaration

public long data

## Field Value

ТҮРЕ	DESCRIPTION
System.Int64	

## Methods

## eDTyp()

Declaration

public FieldMDEnums.eDTyp eDTyp()

#### Returns

ТҮРЕ	DESCRIPTION
FieldMDEnums.eDTyp	

## Equals (Wrangler HDF5. HDF5 Data Type)

Declaration

public bool Equals(WranglerHDF5.HDF5DataType arg)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
WranglerHDF5.HDF5DataType	arg	

## Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

## **Extension Methods**

JavaLikeExtensions.toString(Object)

# Class WranglerXSD

Inheritance

System.Object

WranglerXSD

RecordSetMD.\_\_SchemaMatter

Inherited Members

System.Object.ToString()

System.Object.Equals(System.Object)

System.Object.Equals(System.Object, System.Object)

System.Object.ReferenceEquals(System.Object, System.Object)

System.Object.GetHashCode()

System.Object.GetType()

System.Object.MemberwiseClone()

Namespace: com.WDataSci.JniPMML

Assembly: JniPMML-Cs.dll

Syntax

public class WranglerXSD

#### Methods

#### mReadMapFor(RecordSetMD, JniPMMLItem, PrintWriter, Boolean)

Declaration

public void mReadMapFor(RecordSetMD aRecordSetMD, JniPMMLItem aJniPMMLItem, PrintWriter pw, bool bFillDictionaryNames)

#### **Parameters**

ТУРЕ	NAME	DESCRIPTION
RecordSetMD	aRecordSetMD	
JniPMMLItem	аJniPMMLItem	
PrintWriter	pw	
System.Boolean	bFillDictionaryNames	

## mReadMapFor(XmlDocument, RecordSetMD, JniPMMLItem, PrintWriter, Boolean)

Declaration

public void mReadMapFor(XmlDocument aDoc, RecordSetMD aRecordSetMD, JniPMMLItem aJniPMMLItem, PrintWriter pw, bool bFillDictionaryNames)

ТҮРЕ	NAME	DESCRIPTION
System.Xml.XmlDocument	aDoc	
RecordSetMD	aRecordSetMD	

ТҮРЕ	NAME	DESCRIPTION
JniPMMLItem	aJniPMMLItem	
PrintWriter	pw	
System.Boolean	bFillDictionaryNames	

## XSDColumn(String, String)

Declaration

public static string XSDColumn(string name, string dtyp)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	name	
System.String	dtyp	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## XSDFooter()

Declaration

public static string XSDFooter()

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## XSDHeader()

Declaration

public static string XSDHeader()

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## XSDRecordSet\_Close()

Declaration

public static string XSDRecordSet\_Close()

ТҮРЕ	DESCRIPTION
System.String	

## XSDRecordSet\_Open(String, String)

Declaration

public static string XSDRecordSet\_Open(string rns, string rn)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	rns	
System.String	rn	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## XSDTypes()

Declaration

public static string XSDTypes()

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## **Extension Methods**

JavaLikeExtensions.toString(Object)

# Namespace com.WDataSci.WDS

The com.WDataSci.WDS namespace mirrors the Java com.WDataSci.WDS package, but also contains C# extensions and classes to minimize the code C#/Java code differences.

See Java x Cs Notes for more cross language details.

Syntax

public static class JavaLikeExtensions

### Methods

add<T>(List<T>, T)

Declaration

public static void add<T>(this List<T> self, T v)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Collections.Generic.List <t></t>	self	
Т	V	

### Type Parameters

NAME	DESCRIPTION
Т	

# add<A, B>(List<Map<A, B>>, Map<A, B>)

Declaration

public static void add<A, B>(this List<Map<A, B>> self, Map<A, B> arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Collections.Generic.List <map<a, b="">&gt;</map<a,>	self	
Map <a, b=""></a,>	arg	

Type Parameters

NAME	DESCRIPTION
А	
В	

# add<A, B>(List<Dictionary<A, B>>, Dictionary<A, B>)

Declaration

public static void add<A, B>(this List<Dictionary<A, B>> self, Dictionary<A, B> arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Collections.Generic.List < System.Collections.Generic.Dictionary < A, B > >	self	
System.Collections.Generic.Dictionary < A, B >	arg	

### Type Parameters

NAME	DESCRIPTION
A	
В	

# bln(Int64, Int64[])

Declaration

public static bool bIn(long arg, params long[] args)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int64	arg	
System.Int64[]	args	

### Returns

ТУРЕ	DESCRIPTION
System.Boolean	

# clear<T>(List<T>)

Declaration

public static void clear<T>(this List<T> self)

ТҮРЕ	NAME	DESCRIPTION
System.Collections.Generic.List <t></t>	self	

# Type Parameters

NAME	DESCRIPTION
Т	

### close(CsvWriter)

Declaration

public static void close(this CsvWriter self)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
CsvHelper.CsvWriter	self	

# close(StreamWriter)

Declaration

public static void close(this StreamWriter self)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IO.StreamWriter	self	

# endsWith(String, String)

Declaration

public static bool endsWith(this string self, string arg)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	
System.String	arg	

### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

# equals(String, String)

Declaration

public static bool equals(this string self, string arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	
System.String	arg	

### Returns

ТУРЕ	DESCRIPTION
System.Boolean	

# flush(CsvWriter)

Declaration

public static void flush(this CsvWriter self)

### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
CsvHelper.CsvWriter	self	

# get(String[], Int32)

Declaration

public static string get(this string[] self, int i)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String[]	self	
System.Int32	i	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# get<T>(List<T>, Int32)

Declaration

public static T get<T>(this List<T> self, int i)

ТҮРЕ	NAME	DESCRIPTION
System.Collections.Generic.List <t></t>	self	
System.Int32	i	

### Returns

ТҮРЕ	DESCRIPTION
Т	

# Type Parameters

NAME	DESCRIPTION
Т	

# get<A, B>(Dictionary<A, B>, A)

Declaration

public static B get<A, B>(this Dictionary<A, B> self, A arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Collections.Generic.Dictionary < A, B >	self	
A	arg	

### Returns

ТҮРЕ	DESCRIPTION
В	

# Type Parameters

NAME	DESCRIPTION
А	
В	

# get<A, B>(List<Dictionary<A, B>>, Int32)

Declaration

public static Dictionary<A, B> get<A, B>(this List<Dictionary<A, B>> self, int i)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Collections.Generic.List < System.Collections.Generic.Dictionary < A, B > >	self	
System.Int32	i	

ТҮРЕ	DESCRIPTION
System.Collections.Generic.Dictionary < A, B >	

### Type Parameters

NAME	DESCRIPTION
A	
В	

# getBytes(String)

Declaration

public static byte[] getBytes(this string self)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	

### Returns

ТҮРЕ	DESCRIPTION
System.Byte[]	

# getLength(XmlNodeList)

Declaration

public static int getLength(this XmlNodeList self)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Xml.XmlNodeList	self	

# Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# indexOf(String, String)

Declaration

public static int indexOf(this string self, string arg)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	
System.String	arg	

ТУРЕ	DESCRIPTION
System.Int32	

# isEmpty(String)

Declaration

public static bool isEmpty(this string self)

# Parameters

ТУРЕ	NAME	DESCRIPTION
System.String	self	

### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

# lastIndexOf(String, String)

Declaration

public static int lastIndexOf(this string self, string arg)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	
System.String	arg	

# Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# length(String)

Declaration

public static int length(this string self)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	

ТҮРЕ	DESCRIPTION
System.Int32	

# new\_String(String)

Declaration

public static string new\_String(string arg)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.String	arg	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# printRecord(CsvWriter, List<String>)

Declaration

public static void printRecord(this CsvWriter self, List<string> arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
CsvHelper.CsvWriter	self	
System.Collections.Generic.List < System.String >	arg	

# printRecord(CsvWriter, String[])

Declaration

public static void printRecord(this CsvWriter self, string[] arg)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
CsvHelper.CsvWriter	self	
System.String[]	arg	

# replaceAll(String, String, String)

Declaration

public static string replaceAll(this string self, string RegexToFind, string RegexToReplaceWith)

System.String self	
System.String RegexToFind	

ТҮРЕ	NAME	DESCRIPTION
System.String	RegexToReplaceWith	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# ReplaceAll(String, String, String)

Declaration

public static string ReplaceAll(this string self, string RegexToFind, string RegexToReplaceWith)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	
System.String	RegexToFind	
System.String	RegexToReplaceWith	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# size(String[])

Declaration

public static int size(this string[] self)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String[]	self	

### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# size < T > (List < T >)

Declaration

public static int size<T>(this List<T> self)

ТҮРЕ	NAME	DESCRIPTION
System.Collections.Generic.List <t></t>	self	

### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

### Type Parameters

NAME	DESCRIPTION
Т	

# startsWith(String, String)

Declaration

public static bool startsWith(this string self, string arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	
System.String	arg	

### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

# substring(String, Int32)

Declaration

public static string substring(this string self, int start)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	
System.Int32	start	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# substring(String, Int32, Int32)

Declaration

# public static string substring(this string self, int start, int len)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	
System.Int32	start	
System.Int32	len	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

# toLowerCase(String)

Declaration

public static string toLowerCase(this string self)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	self	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# toString(Object)

Declaration

public static string toString(this object self)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Object	self	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# toString(String)

Declaration

public static string toString(this string self)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.String	self	

ТҮРЕ	DESCRIPTION
System.String

ТҮРЕ	DESCRIPTION
System.String	

# CleanAsNMTokenXSD(String)

Declaration

[ExcelFunction(Name = "CleanAsNMTokenXSD", Category = "WDS", Description = "Returns a clean and valid \\c\*
NMToken (name token) string for a given input, through \\uFFFF. Note use CleanAsNMTokenXSD where the first
character is not treated differently.", IsVolatile = false, ExplicitRegistration = true)]
public static string CleanAsNMTokenXSD([ExcelArgument(Name = "aInputString", Description = "A general
string")] string arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

### Clean As Token (String)

Declaration

[ExcelFunction(Name = "CleanAsToken", Category = "WDS", Description = "Returns a TOKEN of the input string
where white-space is normalized. Additionally, ascii non-printables are removed.", IsVolatile = false,
ExplicitRegistration = true)]
public static string CleanAsToken([ExcelArgument(Name = "aInputString", Description = "A general string")]
string arg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

### CleanDeadWhiteSpaceInXML(String)

Declaration

[ExcelFunction(Name = "CleanDeadWhiteSpaceInXML", Category = "WDS", Description = "Removes inter-element space and non-printables in XML", IsVolatile = false, ExplicitRegistration = true)] public static string CleanDeadWhiteSpaceInXML([ExcelArgument(Name = "aInputString", Description = "A general string")] string arg)

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

### CleanQuotes(String)

#### Declaration

```
[ExcelFunction(Name = "CleanQuotes", Category = "WDS", Description = "Removes double or single quotes.",
IsVolatile = false, ExplicitRegistration = true)]
public static string CleanQuotes(string arg)
```

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

# CleanStringWithRegex(String, String, String)

Declaration

```
[ExcelFunction(Name = "CleanStringWithRegex", Category = "WDS", Description = "Performs a C# eval of Regex.Replace(InputString,RegexToFind,RegexToReplaceWith)", IsVolatile = false, ExplicitRegistration = true)] public static string CleanStringWithRegex([ExcelArgument(Name = "InputString", Description = "A general string")] string arg0, [ExcelArgument(Name = "RegexToFind", Description = "A Regex Expression")] string arg1, [ExcelArgument(Name = "RegexToReplaceWith", Description = "Replacement String")] string arg2)
```

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	arg0	
System.String	arg1	
System.String	arg2	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# FetchFileAsString(String)

Declaration

[ExcelFunction(Name = "FetchFileAsString", Category = "WDS", Description = "Pulls the contents of a file and
returns as one string.", ExplicitRegistration = true)]
public static string FetchFileAsString([ExcelArgument(Name = "FileName")] string arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

# MatchingNullity(Object, Object)

Declaration

public static bool MatchingNullity(object A, object B)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Object	А	
System.Object	В	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

# MatchingNullity(String, String)

Declaration

public static bool MatchingNullity(string A, string B)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	А	
System.String	В	

### Returns

ТУРЕ	DESCRIPTION
System.Boolean	

# MatchingNullityAndValueEquals(String, String)

Declaration

# public static bool MatchingNullityAndValueEquals(string A, string B)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	А	
System.String	В	

### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

# PathAndName(String, String)

Declaration

public static string PathAndName(string aPath, string aFileName)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	aPath	
System.String	aFileName	

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# **Extension Methods**

JavaLikeExtensions.toString(Object)

# Class WDSCommon

Inheritance

System.Object

System.Object.ReferenceEquals(System.Object, System.Object)

System.Object.GetHashCode()

System.Object.MemberwiseClone()

Namespace: com.WDataSci.WDS

Assembly: JniPMML-Cs.dll

Syntax

public class WDSException : Exception, ISerializable, \_Exception

### Constructors

# WDSException(String)

Declaration

public WDSException(string msg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	msg	

### WDSException(String, WDSException)

Declaration

public WDSException(string msg, WDSException e)

ТҮРЕ	NAME	DESCRIPTION
System.String	msg	
WDSException	е	

# WDSException(String, Exception)

Declaration

public WDSException(string msg, Exception e)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	msg	
System.Exception	е	

# Fields

\_\_Message

Declaration

public string \_\_Message

### Field Value

ТҮРЕ	DESCRIPTION
System.String	

# Methods

# getMessage()

Declaration

public string getMessage()

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# toString()

Declaration

public string toString()

ТҮРЕ	DESCRIPTION
System.String	

# Implements

System.Runtime.Serialization.ISerializable System.Runtime.InteropServices.\_Exception

# **Extension Methods**

JavaLikeExtensions.toString(Object)

The JNI namespace (and the files in the JNICode subdirectory of the project) come from an excellent article by Simon Agholor, Using the Java Native Interface in C#, with a link to source code.

Here there are some minor changes. Most notably, a slight adjustment on thrown exceptions and some additional signature handling. In particular, the passing of a direct ByteBuffer has been added for passing large block of data from C# to Java/jni more efficiently.

# Class JavaNativeInterface

System.Object.GetHashCode()

System.Object.GetType()

System.Object.MemberwiseClone()

Namespace: JNI

Assembly: JniPMML-Cs.dll

Syntax

public class JavaNativeInterface : IDisposable

# **Properties**

### AttachToCurrentJVMThread

Declaration

public bool AttachToCurrentJVMThread { get; set; }

### Property Value

ТҮРЕ	DESCRIPTION	
System.Boolean		

### Methods

CallMethod<T>(IntPtr, Boolean, String, List<Object>)

Declaration

public T CallMethod<T>(IntPtr methodId, bool bIsStaticMethod, string sig, List<object> param)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	methodId	
System.Boolean	blsStaticMethod	
System.String	sig	
System.Collections.Generic.List < System.Object >	param	

ТҮРЕ	DESCRIPTION
Т	

# Type Parameters

NAME	DESCRIPTION
Т	

# CallMethod<T>(String, String, List<Object>)

Declaration

public T CallMethod<T>(string methodName, string sig, List<object> param)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	methodName	
System.String	sig	
System.Collections.Generic.List < System.Object >	param	

### Returns

ТҮРЕ	DESCRIPTION
Т	

# Type Parameters

NAME	DESCRIPTION
Т	

# CallVoidMethod(String, String, List<Object>)

Declaration

public void CallVoidMethod(string methodName, string sig, List<object> param)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	methodName	
System.String	sig	
System.Collections.Generic.List < System.Object >	param	

# Dispose()

Declaration

public void Dispose()

# Dispose(Boolean)

Declaration

protected virtual void Dispose(bool disposing)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Boolean	disposing	

### Env()

Declaration

public JNIEnv Env()

# Returns

ТУРЕ	DESCRIPTION
JNIEnv	

### Finalize()

Declaration

protected void Finalize()

# FindClassID(String)

Declaration

public IntPtr FindClassID(string ClassName)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	ClassName	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# FindClassObjectID(IntPtr)

Declaration

public IntPtr FindClassObjectID(IntPtr ClassID)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	ClassID	

ТУРЕ	DESCRIPTION
System.IntPtr	

# FindMethodID(IntPtr, String, String)

Declaration

public IntPtr FindMethodID(IntPtr ClassObjID, string MethodName, string Signature)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	ClassObjID	
System.String	MethodName	
System.String	Signature	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# FindStaticMethodID(IntPtr, String, String)

Declaration

public IntPtr FindStaticMethodID(IntPtr ClassObjID, string MethodName, string Signature)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	ClassObjID	
System.String	MethodName	
System.String	Signature	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# InstantiateJavaObject(String)

Declaration

public void InstantiateJavaObject(string ClassName)

ТҮРЕ	NAME	DESCRIPTION
System.String	ClassName	

# JavaVersion()

Declaration

public string JavaVersion()

### Returns

ТҮРЕ	DESCRIPTION
System.String	

# LoadVM(Dictionary<String, String>, Boolean)

Declaration

public void LoadVM(Dictionary<string, string> options, bool AddToExistingJVM)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Collections.Generic.Dictionary < System.String, System.String>	options	
System.Boolean	AddToExistingJVM	

# Implements

System.IDisposable

Syntax

public class JavaVM : IDisposable

#### Constructors

#### JavaVM(IntPtr)

Declaration

public JavaVM(IntPtr pointer)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	pointer	

#### Fields

CC

Declaration

public const CallingConvention CC = CallingConvention.Winapi

### Field Value

ТҮРЕ	DESCRIPTION
System.Runtime.InteropServices.CallingConvention	

### Methods

AttachCurrentThreadAsDaemon(out JNIEnv, Nullable < JavaVMInitArgs >)

Declaration

public int AttachCurrentThreadAsDaemon(out JNIEnv penv, JavaVMInitArgs? args)

ТҮРЕ	NAME	DESCRIPTION
JNIEnv	penv	
System.Nullable < JavaVMInitArgs >	args	

ТҮРЕ	DESCRIPTION
System.Int32	

# Boolean To Byte (Boolean)

Declaration

public static byte BooleanToByte(bool value)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Boolean	value	

#### Returns

ТҮРЕ	DESCRIPTION
System.Byte	

# ByteToBoolean(Byte)

Declaration

public static bool ByteToBoolean(byte b)

# Parameters

ТУРЕ	NAME	DESCRIPTION
System.Byte	b	

## Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

# DestroyJavaVM()

Declaration

public int DestroyJavaVM()

ТҮРЕ	DESCRIPTION
System.Int32	

### DetachCurrentThread()

Declaration

public int DetachCurrentThread()

Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# Dispose()

Declaration

public void Dispose()

# Dispose(Boolean)

Declaration

protected virtual void Dispose(bool disposing)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.Boolean	disposing	

### Finalize()

Declaration

protected void Finalize()

# GetDelegateForFunctionPointer<T>(IntPtr, ref T)

Declaration

public static void GetDelegateForFunctionPointer<T>(IntPtr ptr, ref T res)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	ptr	
Т	res	

#### Type Parameters

NAME	DESCRIPTION
Т	

### GetEnv(out JNIEnv, Int32)

Declaration

public int GetEnv(out JNIEnv penv, int version)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
JNIEnv	penv	
System.Int32	version	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# Implements

#### Methods

### CallBooleanMethod(IntPtr, IntPtr, JValue[])

Declaration

public bool CallBooleanMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodId	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

### CallByteMethod(IntPtr, IntPtr, JValue[])

Declaration

public byte CallByteMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	

ТҮРЕ	NAME	DESCRIPTION	
System.IntPtr	methodId		
JValue[]	args		

ТҮРЕ	DESCRIPTION
System.Byte	

# CallCharMethod(IntPtr, IntPtr, JValue[])

Declaration

public char CallCharMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodId	
JValue[]	args	

#### Returns

ТУРЕ	DESCRIPTION
System.Char	

# CallDoubleMethod(IntPtr, IntPtr, JValue[])

Declaration

public double CallDoubleMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodId	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Double	

# CallFloatMethod(IntPtr, IntPtr, JValue[])

Declaration

public float CallFloatMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodId	
JValue[]	args	

### Returns

ТҮРЕ	DESCRIPTION
System.Single	

# CallIntMethod(IntPtr, IntPtr, JValue[])

Declaration

public int CallIntMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodId	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# CallLongMethod(IntPtr, IntPtr, JValue[])

Declaration

public long CallLongMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

# Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodId	
JValue[]	args	

ТУРЕ	DESCRIPTION
System.Int64	

# CallObjectMethod(IntPtr, IntPtr, JValue[])

Declaration

public IntPtr CallObjectMethod(IntPtr obj, IntPtr methodID, params JValue[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodID	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# CallShortMethod(IntPtr, IntPtr, JValue[])

Declaration

public short CallShortMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodId	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int16	

# CallStaticBooleanMethod(IntPtr, IntPtr, JValue[])

Declaration

public bool CallStaticBooleanMethod(IntPtr jniClass, IntPtr MethodId, params JValue[] args)

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	MethodId	
JValue[]	args	

ТҮРЕ	DESCRIPTION
System.Boolean	

# CallStaticByteMethod(IntPtr, IntPtr, JValue[])

### Declaration

public byte CallStaticByteMethod(IntPtr jniClass, IntPtr MethodId, params JValue[] args)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	MethodId	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Byte	

# CallStaticCharMethod(IntPtr, IntPtr, JValue[])

### Declaration

public char CallStaticCharMethod(IntPtr jniClass, IntPtr MethodId, params JValue[] args)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	MethodId	
JValue[]	args	

ТҮРЕ	DESCRIPTION
System.Char	

### CallStaticDoubleMethod(IntPtr, IntPtr, JValue[])

Declaration

public double CallStaticDoubleMethod(IntPtr jniClass, IntPtr MethodId, params JValue[] args)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	MethodId	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION	
System.Double		

# CallStaticFloatMethod(IntPtr, IntPtr, JValue[])

Declaration

public float CallStaticFloatMethod(IntPtr jniClass, IntPtr MethodId, params JValue[] args)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	MethodId	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Single	

# CallStaticIntMethod(IntPtr, IntPtr, JValue[])

Declaration

public int CallStaticIntMethod(IntPtr jniClass, IntPtr MethodId, params JValue[] args)

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	MethodId	
JValue[]	args	

ТҮРЕ	DESCRIPTION
System.Int32	

# CallStaticLongMethod(IntPtr, IntPtr, JValue[])

#### Declaration

public long CallStaticLongMethod(IntPtr jniClass, IntPtr MethodId, params JValue[] args)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	MethodId	
JValue[]	args	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int64	

# CallStaticObjectMethod(IntPtr, IntPtr, JValue[])

Declaration

public IntPtr CallStaticObjectMethod(IntPtr obj, IntPtr methodID, params JValue[] args)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodID	
JValue[]	args	

## Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# CallStaticShortMethod(IntPtr, IntPtr, JValue[])

Declaration

public short CallStaticShortMethod(IntPtr jniClass, IntPtr MethodId, params JValue[] args)

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	MethodId	
JValue[]	args	

ТҮРЕ	DESCRIPTION
System.Int16	

# CallStaticVoidMethod(IntPtr, IntPtr, JValue[])

Declaration

public void CallStaticVoidMethod(IntPtr jniClass, IntPtr methodId, params JValue[] args)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.IntPtr	methodId	
JValue[]	args	

### CallVoidMethod(IntPtr, IntPtr, JValue[])

Declaration

public void CallVoidMethod(IntPtr obj, IntPtr methodId, params JValue[] args)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	methodId	
JValue[]	args	

# CatchJavaException()

Declaration

public string CatchJavaException()

ТҮРЕ	DESCRIPTION
System.String	

# CheckJavaExceptionAndThrow()

Declaration

public bool CheckJavaExceptionAndThrow()

Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

# Dispose()

Declaration

public void Dispose()

# Dispose(Boolean)

Declaration

protected virtual void Dispose(bool disposing)

**Parameters** 

ТҮРЕ	NAME	DESCRIPTION
System.Boolean	disposing	

# ExceptionClear()

Declaration

public void ExceptionClear()

# ExceptionDescribe()

Declaration

public void ExceptionDescribe()

### ExceptionOccurred()

Declaration

public IntPtr ExceptionOccurred()

Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# FatalError(String)

Declaration

public void FatalError(string message)

ТҮРЕ	NAME	DESCRIPTION
System.String	message	

# Finalize()

Declaration

protected void Finalize()

# FindClass(String)

Declaration

public IntPtr FindClass(string name)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	name	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

## FromReflectedField(IntPtr)

Declaration

public IntPtr FromReflectedField(IntPtr FieldId)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	FieldId	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# FromReflectedMethod(IntPtr)

Declaration

public IntPtr FromReflectedMethod(IntPtr methodId)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	methodId	

ТҮРЕ	DESCRIPTION
System.IntPtr	

# GetArrayLength(IntPtr)

Declaration

public int GetArrayLength(IntPtr obj)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	obj	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# GetBooleanField(IntPtr, IntPtr)

Declaration

public bool GetBooleanField(IntPtr obj, IntPtr fieldID)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

## Returns

ТУРЕ	DESCRIPTION
System.Boolean	

# GetByteField(IntPtr, IntPtr)

Declaration

public byte GetByteField(IntPtr obj, IntPtr fieldID)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

ТҮРЕ	DESCRIPTION
System.Byte	

# GetCharField(IntPtr, IntPtr)

Declaration

public char GetCharField(IntPtr obj, IntPtr fieldID)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

#### Returns

ТҮРЕ	DESCRIPTION
System.Char	

# GetDirectBufferAddress(IntPtr)

Declaration

public IntPtr GetDirectBufferAddress(IntPtr buf)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	buf	

## Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# GetDirectBufferCapacity(IntPtr)

Declaration

public long GetDirectBufferCapacity(IntPtr buf)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	buf	

ТҮРЕ	DESCRIPTION
System.Int64	

# GetDoubleField(IntPtr, IntPtr)

Declaration

public double GetDoubleField(IntPtr obj, IntPtr fieldID)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

### Returns

ТҮРЕ	DESCRIPTION
System.Double	

# GetFieldID(IntPtr, String, String)

Declaration

public IntPtr GetFieldID(IntPtr jniClass, string name, string sig)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.String	name	
System.String	sig	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

### GetFloatField(IntPtr, IntPtr)

Declaration

public float GetFloatField(IntPtr obj, IntPtr fieldID)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

ТҮРЕ	DESCRIPTION
System.Single	

# GetIntArray(IntPtr)

Declaration

public int[] GetIntArray(IntPtr obj)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	

### Returns

ТҮРЕ	DESCRIPTION
System.Int32[]	

### GetIntField(IntPtr, IntPtr)

Declaration

public int GetIntField(IntPtr obj, IntPtr fieldID)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

### GetJavaVM()

Declaration

public JavaVM GetJavaVM()

### Returns

ТҮРЕ	DESCRIPTION
JavaVM	

# GetLongField(IntPtr, IntPtr)

Declaration

public long GetLongField(IntPtr obj, IntPtr fieldID)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int64	

# GetMajorVersion()

Declaration

public int GetMajorVersion()

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# GetMethodId(IntPtr, String, String)

Declaration

public IntPtr GetMethodId(IntPtr jniClass, string name, string sig)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.String	name	
System.String	sig	

# Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# GetMinorVersion()

Declaration

public int GetMinorVersion()

ТҮРЕ	DESCRIPTION
System.Int32	

# GetObjectField(IntPtr, IntPtr)

Declaration

public IntPtr GetObjectField(IntPtr obj, IntPtr fieldID)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# GetShortField(IntPtr, IntPtr)

Declaration

public short GetShortField(IntPtr obj, IntPtr fieldID)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	obj	
System.IntPtr	fieldID	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int16	

# GetStaticBooleanField(IntPtr, IntPtr)

Declaration

public bool GetStaticBooleanField(IntPtr clazz, IntPtr fieldID)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	clazz	
System.IntPtr	fieldID	

ТҮРЕ	DESCRIPTION
System.Boolean	

# GetStaticByteField(IntPtr, IntPtr)

Declaration

public byte GetStaticByteField(IntPtr classHandle, IntPtr fieldID)

#### **Parameters**

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	fieldID	

#### Returns

ТҮРЕ	DESCRIPTION
System.Byte	

# GetStaticCharField(IntPtr, IntPtr)

Declaration

public char GetStaticCharField(IntPtr classHandle, IntPtr fieldID)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	fieldID	

#### Returns

ТҮРЕ	DESCRIPTION
System.Char	

# GetStaticDoubleField(IntPtr, IntPtr)

Declaration

public double GetStaticDoubleField(IntPtr classHandle, IntPtr fieldID)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	fieldID	

ТҮРЕ	DESCRIPTION
System.Double	

# GetStaticFieldID(IntPtr, String, String)

Declaration

public IntPtr GetStaticFieldID(IntPtr classHandle, string name, string sig)

#### **Parameters**

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.String	name	
System.String	sig	

#### Returns

ТУРЕ	DESCRIPTION	
System.IntPtr		

# GetStaticFloatField(IntPtr, IntPtr)

Declaration

public float GetStaticFloatField(IntPtr classHandle, IntPtr fieldID)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	fieldID	

#### Returns

ТҮРЕ	DESCRIPTION
System.Single	

### GetStaticIntField(IntPtr, IntPtr)

Declaration

public int GetStaticIntField(IntPtr classHandle, IntPtr fieldID)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	fieldID	

ТУРЕ	DESCRIPTION
System.Int32	

# GetStaticLongField(IntPtr, IntPtr)

Declaration

public long GetStaticLongField(IntPtr classHandle, IntPtr fieldID)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	fieldID	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int64	

# GetStaticMethodID(IntPtr, String, String)

Declaration

public IntPtr GetStaticMethodID(IntPtr jniClass, string name, string sig)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	jniClass	
System.String	name	
System.String	sig	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# GetStaticObjectField(IntPtr, IntPtr)

Declaration

public IntPtr GetStaticObjectField(IntPtr clazz, IntPtr fieldID)

System.IntPtr clazz	

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	fieldID	

ТҮРЕ	DESCRIPTION
System.IntPtr	

# GetStaticShortField(IntPtr, IntPtr)

Declaration

public short GetStaticShortField(IntPtr classHandle, IntPtr fieldID)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	fieldID	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int16	

### GetVersion()

Declaration

public int GetVersion()

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# IsAssignableFrom(IntPtr, IntPtr)

Declaration

public byte IsAssignableFrom(IntPtr subclassHandle, IntPtr superclassHandle)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	subclassHandle	
System.IntPtr	superclass Handle	

ТҮРЕ	DESCRIPTION
System.Byte	

# NewByteArray(Int32, IntPtr)

Declaration

public IntPtr NewByteArray(int len, IntPtr classHandle)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	len	
System.IntPtr	class Handle	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewCharArray(Int32, IntPtr)

Declaration

public IntPtr NewCharArray(int len, IntPtr classHandle)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	len	
System.IntPtr	classHandle	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewDirectByteBuffer(IntPtr, Int64)

Declaration

public IntPtr NewDirectByteBuffer(IntPtr address, long capacity)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	address	
System.Int64	capacity	

ТУРЕ	DESCRIPTION
System.IntPtr	

# NewDoubleArray(Int32, IntPtr)

Declaration

public IntPtr NewDoubleArray(int len, IntPtr classHandle)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	len	
System.IntPtr	classHandle	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewFloatArray(Int32, IntPtr)

Declaration

public IntPtr NewFloatArray(int len, IntPtr classHandle)

### Parameters

ТУРЕ	NAME	DESCRIPTION
System.Int32	len	
System.IntPtr	classHandle	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

### NewGlobalRef(IntPtr)

Declaration

public IntPtr NewGlobalRef(IntPtr objectHandle)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	objectHandle	

ТУРЕ	DESCRIPTION
System.IntPtr	

# NewIntArray(Int32, IntPtr)

Declaration

public IntPtr NewIntArray(int len, IntPtr classHandle)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	len	
System.IntPtr	classHandle	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewLongArray(Int32, IntPtr)

Declaration

public IntPtr NewLongArray(int len, IntPtr classHandle)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	len	
System.IntPtr	classHandle	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewObject(IntPtr, IntPtr, JValue[])

Declaration

public IntPtr NewObject(IntPtr classHandle, IntPtr methodID, params JValue[] args)

System.IntPtr classHandle	
System.IntPtr methodID	

ТҮРЕ	NAME	DESCRIPTION
JValue[]	args	

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewObjectArray(Int32, IntPtr, IntPtr)

Declaration

public IntPtr NewObjectArray(int len, IntPtr classHandle, IntPtr init)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	len	
System.IntPtr	class Handle	
System.IntPtr	init	

### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewShortArray(Int32, IntPtr)

Declaration

public IntPtr NewShortArray(int len, IntPtr classHandle)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Int32	len	
System.IntPtr	classHandle	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewString(String, Int32)

Declaration

public IntPtr NewString(string unicode, int len)

ТҮРЕ	NAME	DESCRIPTION
System.String	unicode	
System.Int32	len	

ТҮРЕ	DESCRIPTION
System.IntPtr	

# NewStringUFT(IntPtr)

Declaration

public IntPtr NewStringUFT(IntPtr UFT)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	UFT	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

## RegisterNatives(IntPtr, JNINativeMethod\*, Int32)

Declaration

public int RegisterNatives(IntPtr classHandle, JNINativeMethod\*methods, int nMethods)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
JNINativeMethod*	methods	
System.Int32	nMethods	

### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# SetObjectArrayElement(IntPtr, Int32, IntPtr)

Declaration

public void SetObjectArrayElement(IntPtr array, int index, IntPtr val)

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	array	
System.Int32	index	
System.IntPtr	val	

### ThrowNew(IntPtr, String)

Declaration

public void ThrowNew(IntPtr classHandle, string message)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.String	message	

### ToReflectedField(IntPtr, IntPtr, Boolean)

Declaration

public IntPtr ToReflectedField(IntPtr classHandle, IntPtr fieldID, bool isStatic)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	fieldID	
System.Boolean	isStatic	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ToReflectedMethod(IntPtr, IntPtr, Boolean)

Declaration

public IntPtr ToReflectedMethod(IntPtr classHandle, IntPtr methodId, bool isStatic)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	
System.IntPtr	methodId	

ТҮРЕ	NAME	DESCRIPTION
System.Boolean	isStatic	

#### Returns

ТҮРЕ	DESCRIPTION
System.IntPtr	

## UnregisterNatives(IntPtr)

Declaration

public int UnregisterNatives(IntPtr classHandle)

#### Parameters

ТУРЕ	NAME	DESCRIPTION
System.IntPtr	classHandle	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

# Implements

System.IDisposable

### **Extension Methods**

JavaLikeExtensions.toString(Object)

# Struct JNINativeInterface

Inherited Members

System.ValueType.Equals(System.Object)

System.ValueType.GetHashCode()

System.ValueType.ToString()

System.Object.Equals(System.Object, System.Object)

System. Object. Reference Equals (System. Object, System. Object)

System.Object.GetType()

Namespace: JNI

Assembly: JniPMML-Cs.dll

Syntax

public struct JNINativeInterface

#### Fields

#### AllocObject

Declaration

public IntPtr AllocObject

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### CallBooleanMethod

Declaration

public IntPtr CallBooleanMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Boolean Method A

Declaration

public IntPtr CallBooleanMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallBooleanMethodV

Declaration

public IntPtr CallBooleanMethodV

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf CallByteMethod}$

Declaration

public IntPtr CallByteMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf CallByteMethodA}$

Declaration

public IntPtr CallByteMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf CallByteMethodV}$

Declaration

public IntPtr CallByteMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallCharMethod

Declaration

public IntPtr CallCharMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Char Method A

Declaration

public IntPtr CallCharMethodA

ТҮРЕ	DESCRIPTION
System.IntPtr	

### CallCharMethodV

Declaration

public IntPtr CallCharMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallDoubleMethod

Declaration

public IntPtr CallDoubleMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallDoubleMethodA

Declaration

public IntPtr CallDoubleMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallDoubleMethodV

Declaration

public IntPtr CallDoubleMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallFloatMethod

Declaration

public IntPtr CallFloatMethod

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Float Method A

Declaration

public IntPtr CallFloatMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallFloatMethodV

Declaration

public IntPtr CallFloatMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallIntMethod

Declaration

public IntPtr CallIntMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallIntMethodA

Declaration

public IntPtr CallIntMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallIntMethodV

Declaration

public IntPtr CallIntMethodV

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Long Method

Declaration

public IntPtr CallLongMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf CallLongMethodA}$

Declaration

public IntPtr CallLongMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf CallLongMethodV}$

Declaration

public IntPtr CallLongMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualBooleanMethod

Declaration

public IntPtr CallNonvirtualBooleanMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Boolean Method A

Declaration

public IntPtr CallNonvirtualBooleanMethodA

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Boolean Method V

Declaration

public IntPtr CallNonvirtualBooleanMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Non virtual Byte Method

Declaration

public IntPtr CallNonvirtualByteMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Nonvirtual Byte Method A

Declaration

public IntPtr CallNonvirtualByteMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Nonvirtual Byte Method V

Declaration

public IntPtr CallNonvirtualByteMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualCharMethod

Declaration

public IntPtr CallNonvirtualCharMethod

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Char Method A

Declaration

public IntPtr CallNonvirtualCharMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Char Method V

Declaration

public IntPtr CallNonvirtualCharMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualDoubleMethod

Declaration

public IntPtr CallNonvirtualDoubleMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualDoubleMethodA

Declaration

public IntPtr CallNonvirtualDoubleMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualDoubleMethodV

Declaration

public IntPtr CallNonvirtualDoubleMethodV

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Float Method

Declaration

public IntPtr CallNonvirtualFloatMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Float Method A

Declaration

public IntPtr CallNonvirtualFloatMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualFloatMethodV

Declaration

public IntPtr CallNonvirtualFloatMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualIntMethod

Declaration

public IntPtr CallNonvirtualIntMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Int Method A

Declaration

public IntPtr CallNonvirtualIntMethodA

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Int Method V

Declaration

public IntPtr CallNonvirtualIntMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf Call Nonvirtual Long Method}$

Declaration

public IntPtr CallNonvirtualLongMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Nonvirtual Long Method A

Declaration

public IntPtr CallNonvirtualLongMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Nonvirtual Long Method V

Declaration

public IntPtr CallNonvirtualLongMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Non virtual Object Method

Declaration

public IntPtr CallNonvirtualObjectMethod

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Nonvirtual Object Method A

Declaration

public IntPtr CallNonvirtualObjectMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Nonvirtual Object Method V

Declaration

public IntPtr CallNonvirtualObjectMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualShortMethod

Declaration

public IntPtr CallNonvirtualShortMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualShortMethodA

Declaration

public IntPtr CallNonvirtualShortMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualShortMethodV

Declaration

public IntPtr CallNonvirtualShortMethodV

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Nonvirtual Void Method

Declaration

public IntPtr CallNonvirtualVoidMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Non virtual Void Method A

Declaration

public IntPtr CallNonvirtualVoidMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallNonvirtualVoidMethodV

Declaration

public IntPtr CallNonvirtualVoidMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf CallObjectMethod}$

Declaration

public IntPtr CallObjectMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Object Method A

Declaration

public IntPtr CallObjectMethodA

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf CallObjectMethodV}$

Declaration

public IntPtr CallObjectMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallShortMethod

Declaration

public IntPtr CallShortMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallShortMethodA

Declaration

public IntPtr CallShortMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallShortMethodV

Declaration

public IntPtr CallShortMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Boolean Method

Declaration

public IntPtr CallStaticBooleanMethod

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Boolean Method A

Declaration

public IntPtr CallStaticBooleanMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Boolean Method V

Declaration

public IntPtr CallStaticBooleanMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Static Byte Method

Declaration

public IntPtr CallStaticByteMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Static Byte Method A

Declaration

public IntPtr CallStaticByteMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Static Byte Method V

Declaration

public IntPtr CallStaticByteMethodV

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Char Method

Declaration

public IntPtr CallStaticCharMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Char Method A

Declaration

public IntPtr CallStaticCharMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallStaticCharMethodV

Declaration

public IntPtr CallStaticCharMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallStaticDoubleMethod

Declaration

public IntPtr CallStaticDoubleMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Double Method A

Declaration

public IntPtr CallStaticDoubleMethodA

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Double Method V

Declaration

public IntPtr CallStaticDoubleMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Float Method

Declaration

public IntPtr CallStaticFloatMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallStaticFloatMethodA

Declaration

public IntPtr CallStaticFloatMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallStaticFloatMethodV

Declaration

public IntPtr CallStaticFloatMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallStaticIntMethod

Declaration

public IntPtr CallStaticIntMethod

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Int Method A

Declaration

public IntPtr CallStaticIntMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Int Method V

Declaration

public IntPtr CallStaticIntMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Static Long Method

Declaration

public IntPtr CallStaticLongMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Static Long Method A

Declaration

public IntPtr CallStaticLongMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Static Long Method V

Declaration

public IntPtr CallStaticLongMethodV

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Static Object Method

Declaration

public IntPtr CallStaticObjectMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Call Static Object Method A

Declaration

public IntPtr CallStaticObjectMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# Call Static Object Method V

Declaration

public IntPtr CallStaticObjectMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallStaticShortMethod

Declaration

public IntPtr CallStaticShortMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Short Method A

Declaration

public IntPtr CallStaticShortMethodA

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Short Method V

Declaration

public IntPtr CallStaticShortMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Void Method

Declaration

public IntPtr CallStaticVoidMethod

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Static Void Method A

Declaration

public IntPtr CallStaticVoidMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallStaticVoidMethodV

Declaration

public IntPtr CallStaticVoidMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallVoidMethod

Declaration

public IntPtr CallVoidMethod

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### Call Void Method A

Declaration

public IntPtr CallVoidMethodA

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### CallVoidMethodV

Declaration

public IntPtr CallVoidMethodV

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### DefineClass

Declaration

public IntPtr DefineClass

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### DeleteGlobalRef

Declaration

public IntPtr DeleteGlobalRef

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### DeleteLocalRef

Declaration

public IntPtr DeleteLocalRef

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Delete Weak Global Ref

Declaration

public IntPtr DeleteWeakGlobalRef

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf Ensure Local Capacity}$

Declaration

public IntPtr EnsureLocalCapacity

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf ExceptionCheck}$

Declaration

public IntPtr ExceptionCheck

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ExceptionClear

Declaration

public IntPtr ExceptionClear

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### ExceptionDescribe

Declaration

public IntPtr ExceptionDescribe

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf ExceptionOccurred}$

Declaration

public IntPtr ExceptionOccurred

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### FatalError

Declaration

public IntPtr FatalError

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### FindClass

Declaration

public IntPtr FindClass

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### FromReflectedField

Declaration

public IntPtr FromReflectedField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### From Reflected Method

Declaration

public IntPtr FromReflectedMethod

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetArrayLength}$

Declaration

public IntPtr GetArrayLength

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetBoolean} Array Elements$

Declaration

public IntPtr GetBooleanArrayElements

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf GetBooleanArrayRegion}$

Declaration

public IntPtr GetBooleanArrayRegion

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### GetBooleanField

Declaration

public IntPtr GetBooleanField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetByteArrayElements}$

Declaration

public IntPtr GetByteArrayElements

ТУРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetByteArrayRegion}$

Declaration

public IntPtr GetByteArrayRegion

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# GetByteField

Declaration

public IntPtr GetByteField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf GetCharArrayElements}$

Declaration

public IntPtr GetCharArrayElements

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetCharArrayRegion}$

Declaration

public IntPtr GetCharArrayRegion

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### ${\sf GetCharField}$

Declaration

public IntPtr GetCharField

ТҮРЕ	DESCRIPTION
System.IntPtr	

### Get Direct Buffer Address

Declaration

public IntPtr GetDirectBufferAddress

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf GetDirectBufferCapacity}$

Declaration

public IntPtr GetDirectBufferCapacity

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetDoubleArrayElements}$

Declaration

public IntPtr GetDoubleArrayElements

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetDoubleArrayRegion}$

Declaration

public IntPtr GetDoubleArrayRegion

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### GetDoubleField

Declaration

public IntPtr GetDoubleField

ТУРЕ	DESCRIPTION
System.IntPtr	

#### GetFieldID

Declaration

public IntPtr GetFieldID

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf GetFloatArrayElements}$

Declaration

 ${\color{red} \textbf{public}} \ \ {\color{gray} \textbf{IntPtr}} \ \ {\color{gray} \textbf{GetFloatArrayElements}}$ 

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf GetFloatArrayRegion}$

Declaration

public IntPtr GetFloatArrayRegion

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### GetFloatField

Declaration

public IntPtr GetFloatField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### GetIntArray Elements

Declaration

public IntPtr GetIntArrayElements

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetIntArrayRegion}$

Declaration

public IntPtr GetIntArrayRegion

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### GetIntField

Declaration

public IntPtr GetIntField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### GetJavaVM

Declaration

public IntPtr GetJavaVM

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetLongArrayElements}$

Declaration

public IntPtr GetLongArrayElements

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetLongArrayRegion}$

Declaration

public IntPtr GetLongArrayRegion

ТУРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetLongField}$

Declaration

public IntPtr GetLongField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### ${\sf GetMethodID}$

Declaration

public IntPtr GetMethodID

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf GetObjectArrayElement}$

Declaration

public IntPtr GetObjectArrayElement

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf GetObjectClass}$

Declaration

public IntPtr GetObjectClass

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetObjectField}$

Declaration

public IntPtr GetObjectField

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetPrimitiveArrayCritical}$

Declaration

public IntPtr GetPrimitiveArrayCritical

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

# ${\sf GetShortArrayElements}$

Declaration

public IntPtr GetShortArrayElements

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetShortArrayRegion}$

Declaration

public IntPtr GetShortArrayRegion

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### GetShortField

Declaration

public IntPtr GetShortField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### ${\sf GetStaticBooleanField}$

Declaration

public IntPtr GetStaticBooleanField

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetStaticByteField}$

Declaration

public IntPtr GetStaticByteField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### ${\sf GetStaticCharField}$

Declaration

public IntPtr GetStaticCharField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### ${\sf GetStaticDoubleField}$

Declaration

public IntPtr GetStaticDoubleField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### GetStaticFieldID

Declaration

public IntPtr GetStaticFieldID

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### ${\sf GetStaticFloatField}$

Declaration

public IntPtr GetStaticFloatField

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### GetStaticIntField

Declaration

public IntPtr GetStaticIntField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetStaticLongField}$

Declaration

public IntPtr GetStaticLongField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### GetStaticMethodID

Declaration

public IntPtr GetStaticMethodID

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

### ${\sf GetStaticObjectField}$

Declaration

public IntPtr GetStaticObjectField

Field Value

ТҮРЕ	DESCRIPTION
System.IntPtr	

#### ${\sf GetStaticShortField}$

Declaration

System.Object.MemberwiseClone()

Namespace: WDataSci.JniPMML Assembly: JniPMML-Cs.dll

Syntax

public class AddIn : IExcelAddIn

#### Fields

\_\_JniPMML

Declaration

public static JniPMML \_\_JniPMML

Field Value

ТҮРЕ	DESCRIPTION
JniPMML	

## Methods

#### AutoClose()

Declaration

public void AutoClose()

# AutoOpen()

Declaration

public void AutoOpen()

## CleanAsNMToken\_ViaJni(String)

Declaration

[ExcelFunction(Name = "CleanAsNMToken\_ViaJni", Category = "WDS.JniPMML", Description = "Returns a NMToken of the input string with invalid characters removed", IsVolatile = false, ExplicitRegistration = true)] public static string CleanAsNMToken\_ViaJni([ExcelArgument(Name = "InputString", Description = "A general string")] string aInputString)

ТҮРЕ	NAME	DESCRIPTION
System.String	alnputString	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## CleanStringWithRegex\_ViaJni(String, String, Object, Object, Object)

#### Declaration

```
[ExcelFunction(Name = "CleanStringWithRegex_ViaJni", Category = "WDS.JniPMML", Description = "Returns a
NMToken of the input string with invalid characters removed", IsVolatile = false, ExplicitRegistration =
true)]
public static string CleanStringWithRegex_ViaJni([ExcelArgument(Name = "InputString")] string aInputString,
[ExcelArgument(Name = "RegexToFind")] string aRegexString, [ExcelArgument(Name = "RegexToReplaceWith")] string
aReplaceWithString, [ExcelArgument(Name = "JVM_class")] object _aClassName, [ExcelArgument(Name =
"JVM_method")] object _aMethodName, [ExcelArgument(Name = "JVM_signature")] object _aSignatureString)
```

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	alnputString	
System.String	aRegexString	
System.String	aReplaceWithString	
System.Object	_aClassName	
System.Object	_aMethodName	
System.Object	_aSignatureString	

## Returns

ТҮРЕ	DESCRIPTION
System.String	

# Dispose()

Declaration

```
public void Dispose()
```

## FetchFileAsString\_ViaJni(String)

Declaration

```
[ExcelFunction(Name = "FetchFileAsString_ViaJni", Category = "WDS.JniPMML", Description = "Pulls the contents of a file and returns as one string.", ExplicitRegistration = true)]
public static string FetchFileAsString_ViaJni([ExcelArgument(Name = "FileName")] string arg1)
```

ТҮРЕ	NAME	DESCRIPTION
System.String	arg1	

#### Returns

ТУРЕ	DESCRIPTION
System.String	

#### Finalize()

Declaration

protected void Finalize()

## HandleMajorFrom(Object)

Declaration

[ExcelFunction(Name = "JniPMML\_HandleMajorFrom", Category = "WDS.JniPMML", Description = "Returns HandleMajor from \"Major.Minor\", or the string that has been parsed and is cached in the JVM. Bad input (such as ExcelError) will return 0 which is the default first handle, returns -2 if not resolvable.", IsVolatile = false, ExplicitRegistration = true)]
public static int HandleMajorFrom([ExcelArgument(Name = "HandleOrTag", Description = "Use a \"Major.Minor\" Handle output from CreateHandle to chain calcuation dependency")] object arg0)

#### **Parameters**

ТУРЕ	NAME	DESCRIPTION
System.Object	arg0	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## JniPMML\_Cmd()

Declaration

[ExcelCommand(Description = "Runs the JniPMML command based on the arguments in a cell.", ExplicitRegistration
= true)]
public static void JniPMML\_Cmd()

## JniPMML\_Cmd\_Prep()

Declaration

[ExcelCommand(Description = "Create Worksheet to demo or call JniPMML java cmd line", ExplicitRegistration =
true)]
public static void JniPMML\_Cmd\_Prep()

## JniPMML\_CreateHandle(String, String, String)

Declaration

```
[ExcelFunction(Name = "JniPMML_CreateHandle", Category = "WDS.JniPMML", Description = "Creates a handle and initializes with a PMML File, input as either a FileName or a String.", IsVolatile = false, ExplicitRegistration = true)]

public static object JniPMML_CreateHandle([ExcelArgument(Name = "HandleType", Description = "
[JniPMML|others....]")] string arg0, [ExcelArgument(Name = "Tag", Description = "String Handle")] string arg1, [ExcelArgument(Name = "FileNameOrString", Description = "Path to external PMML filename or entire file as a string (an entire string is determined by the usual XML starting characters)")] string arg3)
```

ТҮРЕ	NAME	DESCRIPTION
System.String	arg0	
System.String	arg1	
System.String	arg3	

#### Returns

ТҮРЕ	DESCRIPTION
System.Object	

### JniPMML\_Eval(Object, Int32, Object[,])

#### Declaration

[ExcelFunction(Name = "JniPMML\_Eval", Category = "WDS.JniPMML", Description = "Calls JniPMML.Eval based a previously set Header", IsThreadSafe = true, IsMacroType = true, IsVolatile = false, ExplicitRegistration = true)]
public static object[, ] JniPMML\_Eval([ExcelArgument(Name = "HandleOrTag", Description = "Use the \"Major.Minor\" Handle output for the matching Model to maintain dependency")] object arg0,
[ExcelArgument(Name = "InputDataIncludesHeader", Description = "0/1 indicates both to skip eval on first row and whether to include output header")] int bInputDataHasHeaderRow, [ExcelArgument(Name = "InputData", Description = "Select Contiguous ListObject Rows, include header if needed for alignment")] object[, ] data)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.Object	arg0	
System.Int32	bInputDataHasHeaderRow	
System.Object[,]	data	

#### Returns

TYF	PE	DESCRIPTION
Sys	tem.Object[,]	

### JniPMML\_Eval\_CacheHeaders\_guts(Int32, XmlMap, String, Int32)

#### Declaration

protected static object JniPMML\_Eval\_CacheHeaders\_guts(int h, XmlMap xm, string xmschema, int
nOutputStringMaxLength)

ТУРЕ	NAME	DESCRIPTION
System.Int32	h	
Microsoft.Office.Interop.Excel.XmlMap	xm	
System.String	xmschema	
System.Int32	nOutputStringMaxLength	

#### Returns

ТҮРЕ	DESCRIPTION
System.Object	

# JniPMML\_Eval\_CacheHeaders\_Volatile(Object, Object, Object)

#### Declaration

[ExcelFunction(Name = "JniPMML\_Eval\_CacheHeaders\_Volatile", Category = "WDS.JniPMML", Description = "Caches just the input and output headers for Eval, on both the C# and Java sides, subsequent calls to WDS.JniPMML\_Headerless can follow. Set the headerless calls to depend on this \"Major.Minor\" output.", IsThreadSafe = true, IsMacroType = true, IsVolatile = false, ExplicitRegistration = true)] public static object JniPMML\_Eval\_CacheHeaders\_Volatile([ExcelArgument(Name = "HandleOrTag", Description = "Use a \"Major.Minor\" Handle output from CreateHandle to chain calcuation dependency")] object arg0, [ExcelArgument(Name = "XmlMappedList", Description = "Point to a reference cell or range of the XmlMap'd list (one that does not change with data, such as the header)", AllowReference = true)] object arg, [ExcelArgument(Name = "nOutputStringMaxLength", Description = "An alternate maximum string length for output fields, defaults to 64", AllowReference = false)] object \_nOutputStringMaxLength)

#### **Parameters**

ТУРЕ	NAME	DESCRIPTION
System.Object	arg0	
System.Object	arg	
System.Object	_nOutputStringMaxLength	

#### Returns

ТҮРЕ	DESCRIPTION
System.Object	

## JniPMML\_Eval\_OutputColumnHeadings(Object)

#### Declaration

```
[ExcelFunction(Name = "JniPMML_Eval_OutputColumnHeadings", Category = "WDS.JniPMML", Description = "Returns just the field names associated with a cached model and headers", IsThreadSafe = true, IsMacroType = true, IsVolatile = false, ExplicitRegistration = true)]
public static object[, ] JniPMML_Eval_OutputColumnHeadings([ExcelArgument(Name = "HandleOrTag", Description = "Use the \"Major.Minor\" Handle output for the matching Model to maintain dependency")] object arg0)
```

ТҮРЕ	NAME	DESCRIPTION
System.Object	arg0	

#### Returns

ТҮРЕ	DESCRIPTION
System.Object[,]	

#### JniPMML\_Eval\_Volatile(Int32, String, Int32, Object, Object)

#### Declaration

[ExcelFunction(Name = "JniPMML\_Eval\_Volatile", Category = "WDS.JniPMML", Description = "A volatile self contained call to the JniPMML evaluator. The first argument is just to turn it off/on to kill the drag on calculation time.", IsThreadSafe = true, IsMacroType = true, IsVolatile = false, ExplicitRegistration = true)] public static object[, ] JniPMML\_Eval\_Volatile([ExcelArgument(Name = "bToCalcSwitch", Description = "0/1")] int arg0, [ExcelArgument(Name = "PMMLInput", Description = "Path to external PMML filename or entire file as a string (an entire string is determined by the usual XML starting characters)")] string PMMLFile, [ExcelArgument(Name = "bInputDataHasHeaderRow", Description = "0/1, If input includes header row, output will include header row.")] int bInputDataHasHeaderRow, [ExcelArgument(Name = "InputTableReference", Description = "An XMLMap'd Table, column names are taken from the XMLMap", AllowReference = true)] object arg, [ExcelArgument(Name = "nOutputStringMaxLength", Description = "An alternate maximum string length for output fields, defaults to 64", AllowReference = false)] object \_nOutputStringMaxLength)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.Int32	arg0	
System.String	PMMLFile	
System.Int32	bInputDataHasHeaderRow	
System.Object	arg	
System.Object	_nOutputStringMaxLength	

#### Returns

ТҮРЕ	DESCRIPTION
System.Object[,]	

### JniPMML\_Eval\_XmlMappedList()

Declaration

[ExcelCommand(Description = "Evaluate cached PMML on XmlMapped List", ExplicitRegistration = true)]
public static void JniPMML\_Eval\_XmlMappedList()

## JniPMML\_Handle(Object, Object)

Declaration

[ExcelFunction(Name = "JniPMML\_Handle", Category = "WDS.JniPMML", ExplicitRegistration = true, HelpTopic = "Help Topic to be filled in", IsVolatile = false)]
public static string JniPMML\_Handle([ExcelArgument(Name = "HandleOrTag", Description = "Use a \"Major.Minor\"
Handle output from CreateHandle to chain calcuation dependency")] object arg0, [ExcelArgument(Name = "AdditionalRangeDependencies")] object arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.Object	arg0	
System.Object	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

# JniPMML\_Handle\_LastUsed(Object)

#### Declaration

[ExcelFunction(Name = "JniPMML\_Handle\_LastUsed", Description = "Last handle used in Java JniPMML", Category = "WDS.JniPMML", ExplicitRegistration = true, HelpTopic = "Help Topic to be filled in", IsVolatile = false)]
public static string JniPMML\_Handle\_LastUsed([ExcelArgument(Name = "AdditionalRangeDependencies")] object arg)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.Object	arg	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

### JniPMML\_HandleMajor(Object, Object)

### Declaration

[ExcelFunction(Name = "JniPMML\_HandleMajor", Description = "Either returns the HandleMajor of the last or working index, or returns a new handle for the value (filling in all empty values lower)", Category = "WDS.JniPMML", ExplicitRegistration = true, HelpTopic = "Help Topic to be filled in")] public static int JniPMML\_HandleMajor([ExcelArgument(Name = "HandleOrTag", Description = "Use a \"Major.Minor\" Handle output from CreateHandle to chain calcuation dependency")] object arg0, [ExcelArgument(Name = "AdditionalRangeDependencies", Description = "Provides an Excel calculation dependency, otherwise not used")] object deps)

## Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Object	arg0	
System.Object	deps	

#### Returns

ТҮРЕ	DESCRIPTION
System.Int32	

## JniPMML\_isValidHandle(Object)

#### Declaration

```
[ExcelFunction(Name = "JniPMML_isValidHandle", Category = "WDS.JniPMML", ExplicitRegistration = true,
HelpTopic = "Help Topic to be filled in")]
public static bool JniPMML_isValidHandle([ExcelArgument(Name = "HandleOrTag", Description = "Use a
\"Major.Minor\" Handle output from CreateHandle to chain calcuation dependency")] object arg0)
```

#### **Parameters**

ТУРЕ	NAME	DESCRIPTION
System.Object	arg0	

#### Returns

ТҮРЕ	DESCRIPTION
System.Boolean	

### JniPMML\_LoadedFileName(Object)

#### Declaration

[ExcelFunction(Name = "JniPMML\_LoadedFileName", Category = "WDS.JniPMML", Description = "Returns the string
that has been parsed and is cached in the JVM", IsVolatile = false, ExplicitRegistration = true)]
public static string JniPMML\_LoadedFileName([ExcelArgument(Name = "HandleOrTag", Description = "Use a
\"Major.Minor\" Handle output from CreateHandle to chain calcuation dependency")] object arg0)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Object	arg0	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## JniPMML\_LoadedString(Object)

#### Declaration

```
[ExcelFunction(Name = "JniPMML_LoadedString", Category = "WDS.JniPMML", Description = "Returns the string that has been parsed and is cached in the JVM", IsVolatile = false, ExplicitRegistration = true)] public static string JniPMML_LoadedString([ExcelArgument(Name = "HandleOrTag", Description = "Use a \"Major.Minor\" Handle output from CreateHandle to chain calcuation dependency")] object arg0)
```

Parameters

ТУРЕ	NAME	DESCRIPTION
System.Object	arg0	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## JniPMML\_LoadFromFile(Object, String)

#### Declaration

[ExcelFunction(Name = "JniPMML\_LoadFromFile", Category = "WDS.JniPMML", Description = "Creates a handle and parses PMML model from an external file, caching in JVM", IsVolatile = false, ExplicitRegistration = true)] public static string JniPMML\_LoadFromFile([ExcelArgument(Name = "HandleOrTag", Description = "Use a \"Major.Minor\" Handle output from CreateHandle to chain calcuation dependency")] object arg0, [ExcelArgument(Name = "FileName")] string arg1)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Object	arg0	
System.String	arg1	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

## JniPMML\_LoadFromString(Object, String)

### Declaration

[ExcelFunction(Name = "JniPMML\_LoadFromString", Category = "WDS.JniPMML", Description = "Creates a handle and parses PMML model from string input, caching in JVM", IsVolatile = false, ExplicitRegistration = true)] public static string JniPMML\_LoadFromString([ExcelArgument(Name = "HandleOrTag", Description = "Use a \"Major.Minor\" Handle output from CreateHandle to chain calcuation dependency")] object arg0, [ExcelArgument(Name = "FileName")] string arg1)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.Object	arg0	
System.String	arg1	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

[ExcelCommand(Description = "Add XmlMap to List Object", ExplicitRegistration = true)]
public static void JniPMML\_XmlMap\_Helper()

# PathElementOf(String, String)

Declaration

public string PathElementOf(string path, string loc)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	path	
System.String	loc	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

# RegisterFunctions()

Declaration

public void RegisterFunctions()

# UpdateHelpTopic(ExcelFunctionRegistration)

Declaration

public ExcelFunctionRegistration UpdateHelpTopic(ExcelFunctionRegistration funcReg)

### Parameters

ТҮРЕ	NAME	DESCRIPTION
ExcelDna.Registration.ExcelFunctionRegistration	funcReg	

## Returns

ТҮРЕ	DESCRIPTION
ExcelDna.Registration.ExcelFunctionRegistration	

# UpdateMajorMinor(String, Object[])

Declaration

public static JniPMMLItem UpdateMajorMinor(string aEvaluatorType, object[] args)

#### **Parameters**

ТҮРЕ	NAME	DESCRIPTION
System.String	aEvaluatorType	

ТҮРЕ	NAME	DESCRIPTION
System.Object[]	args	

# Returns

ТҮРЕ	DESCRIPTION
JniPMMLItem	

# Implements

 ${\it ExcelDna.} Integration. I {\it ExcelAddIn}$ 

**Extension Methods** 

# Class RibbonController

WDataSci Excel ribbon creation.

Syntax

[ComVisible(true)]

public class RibbonController: ExcelRibbon, IDTExtensibility2, IRibbonExtensibility

### Methods

## GetCustomUI(String)

Declaration

public override string GetCustomUI(string uiName)

#### Parameters

ТҮРЕ	NAME	DESCRIPTION
System.String	uiName	

#### Returns

ТҮРЕ	DESCRIPTION
System.String	

ExcelDna.Integration.CustomUI.ExcelRibbon.GetCustomUI(System.String)

## ShowAboutForm()

Declaration

```
[ExcelCommand(Description = "About", ExplicitRegistration = true)]
public static void ShowAboutForm()
```

#### VBACheck()

Declaration

```
[ExcelCommand(Description = "VBA Module Check", ExplicitRegistration = true)]
public static void VBACheck()
```

### VBACheckRefresh()

Declaration

```
[ExcelCommand(Description = "VBA Module Check Refresh", ExplicitRegistration = true)]
public static void VBACheckRefresh()
```

#### VBACheckRemove()

Declaration

```
[ExcelCommand(Description = "Remove VBA Module Check", ExplicitRegistration = true)]
public static void VBACheckRemove()
```

## VBAComponentAdd\_WDSCore()

Declaration

```
[ExcelCommand(Description = "Add VBA Module: WDSCore", ExplicitRegistration = true)]
public static void VBAComponentAdd_WDSCore()
```

#### VBAComponentAdd\_WDSJniPMML()

Declaration

```
[ExcelCommand(Description = "Add VBA Module: WDSJniPMML", ExplicitRegistration = true)]
public static void VBAComponentAdd_WDSJniPMML()
```

## VBAComponentRemove\_WDSCore()

Declaration

```
[ExcelCommand(Description = "Remove VBA Module: WDSCore", ExplicitRegistration = true)]
public static void VBAComponentRemove_WDSCore()
```

# VBAComponentRemove\_WDSJniPMML()

Declaration

```
[ExcelCommand(Description = "Remove VBA Module: WDSJniPMML", ExplicitRegistration = true)]
public static void VBAComponentRemove_WDSJniPMML()
```

# **Extension Methods**

# **WDS-Cs**

General utilitities that independent of JniPMML code. To simplify assemblies and jars, this code is included in the larger projects, but is also compiled as a stand alone.

The Java style com.WDataSci namespaces are specifically for C# code which mirrors the Java modules.

The C# style namespaces are not specifically mirrored in the Java code.

# Class WDSAddIn

Inheritance
